- Principle of identifying other items:- an item may be placed in two categories if necessary.
- Principle of elimination:- When one category is different from the other ,it sometimes can be eliminated.
- Principle of clarification:- When the meaning of category is not clear clarification should sought from students.
- Principle of not processing final decision:- Since model is based on the process rather than the content so it is not necessary to press for the final decision.
- Principle of mental operation:- The model has overt activities and each overt activity is linked to covert i.e. hidden mental operation.
- Principle of limits:- The inference must be within the limit of the data.

Nisbett,2013-02-01 This book examines two questions Do people make use of abstract rules such as logical and statistical rules when making inferences in everyday life Can such abstract rules be changed by training Contrary to the spirit of reductionist theories from behaviorism to connectionism there is ample evidence that people do make use of abstract rules of inference including rules of logic statistics causal deduction and cost benefit analysis Such rules moreover are easily alterable by instruction as it occurs in classrooms and in brief laboratory training sessions The fact that purely formal training can alter them and that those taught in one content domain can escape to a quite different domain for which they are also highly applicable shows that the rules are highly abstract The major implication for cognitive science is that people are capable of operating with abstract rules even for concrete mundane tasks therefore any realistic model of human inferential capacity must reflect this fact The major implication for education is that people can be far more broadly influenced by training than is generally supposed At high levels of formality and abstraction relatively brief training can alter
