End of an Era

- The Mesozoic Era ended about 65 million years ago with a major extinction of land and marine species.
- Many paleontologists hypothesize that a comet or asteroid collided with Earth, causing a huge cloud of dust and smoke to rise in the atmosphere, blocking out the Sun.

Recent Earth History Claudio Vita-Finzi, 1973 **Paul J. Crutzen and the Anthropocene: A New Epoch in Earth's History** Susanne Benner, Gregor Lax, Paul J. Crutzen, Ulrich Pöschl, Jos Lelieveld, Hans Günter Brauch, 2022-01-01 This book outlines the development and perspectives of the Anthropocene concept by Paul J Crutzen and his colleagues from its inception to its implications for the sciences humanities society and politics The main text consists primarily of articles from peer reviewed scientific journals and other scholarly sources It comprises selected articles on the Anthropocene published by Paul J Crutzen and a selection of related articles mostly but not exclusively by colleagues with whom he collaborated closely In the year 2000 Nobel Laureate Paul J Crutzen proposed the Anthropocene concept as a new epoch in Earth s history Comprehensive collection of articles on the Anthropocene by Paul J Crutzen and his colleagues Unique primary research literature and Crutzen s comprehensive bibliography Paul Crutzen s scientific investigations into human influences on atmospheric chemistry and physics the climate and the Earth system leading to the conception of the Anthropocene Reflections on the Anthropocene and its implications Bibliometric review of the spread of the use of the Anthropocene concept in the Natural and Social Sciences Humanities and Law *Accretion of Extraterrestrial Matter Throughout Earth's History* Bernhard Peucker-Ehrenbrink, Birger Schmitz, 2012-12-06 Every year Earth is bombarded with about 40 000 tons of extraterrestrial material This includes microscopic cosmic dust particles shed by comets and asteroids in outer space meteorites as well as large comets and asteroids that have led to catastrophic events in the geologic past Originally considered only a curiosity extraterrestrial matter found on Earth provides the only samples we have from comets asteroids and other planets Only recently mankind has started to actively collect extraterrestrial matter in space Apollo program Stardust mission rather than to wait for its delivery to Earth Still most of our knowledge of the origin and evolution of our solar system is based on careful studies of meteorites cosmic dust and traces of large impact events in the geologic record such as the mass extinction that terminated the Cretaceous Period and led to the extinction of the dinosaurs This book summarizes our current knowledge of the properties origin orbital evolution and accretion mechanism of extraterrestrial matter accreted on Earth and sheds light on accretion processes and fluxes in the geologic past The chapters in the first part of the book are arranged in order to follow extraterrestrial matter from its origin in space its orbital evolution on its way to Earth its interaction with the Earth magnetosphere and atmosphere to its more or less violent collision with the Earth s surface In the second part of the book several chapters deal with the present day flux of cosmic dust and meteorites to Earth Finally several chapters deal with the reconstruction of the accretion history of extraterrestrial matter on Earth starting with the most recent geologic past and ending with the very early violent accretion period shortly after the formation of Earth Moon and other solid planets in our solar system **Earth System History** Steven M. Stanley, 2004-10-29 Designed for a new generation of readers Stanley s Earth System History is a reforging of his Exploring Earth and Life Through Time

Adopting an earth system approach throughout Earth System History shows students how Earth's ecosystem has developed over time and how events in the past provide a perspective for dealing with present and future changes. Clear and concise the new Second Edition of this introduction to historical geology is perfect for one term non majors courses and contains lots of new content and improved visuals.

New Earth Histories Alison Bashford, Emily M. Kern, Adam Bobbette, 2023-11-06 A kaleidoscopic rethinking of how we come to know the earth. This book brings the history of the geosciences and world cosmologies together exploring many traditions including Chinese, Pacific, Islamic, South and Southeast Asian conceptions of the earth's origin and makeup. Together the chapters ask: How have different ideas about the sacred, animate and earthly changed modern environmental sciences? How have different world traditions understood human and geological origins? How does the inclusion of multiple cosmologies change the meaning of the Anthropocene and the global climate crisis? By carefully examining these questions, *New Earth Histories* sets an ambitious agenda for how we think about the earth. The chapters consider debates about the age and structure of the earth, how humans and earth systems interact, and how empire has been conceived in multiple traditions. The methods the authors deploy are diverse from cultural history and visual and material studies to ethnography, geography and Indigenous studies, and the effect is to highlight how earth knowledge emerged from historically specific situations. *New Earth Histories* provides both a framework for studying science at a global scale and fascinating examples to educate as well as inspire future work. Essential reading for students and scholars of earth science history, environmental humanities, history of science and religion, and science and empire.

Earth's Deep History Martin J. S. Rudwick, 2014-10-15 Tells the story of how natural philosophers developed the ideas of geology accepted today. Fascinating. San Francisco Book Review. Earth has been witness to dinosaurs, global ice ages, continents colliding or splitting apart, and comets and asteroids crashing, as well as the birth of humans who are curious to understand it. But how was all this discovered? How was the evidence for it collected and interpreted? In this sweeping and accessible book, Martin J. S. Rudwick, the premier historian of the Earth sciences, tells the gripping human story of the gradual realization that the Earth's history has not only been long but also astonishingly eventful. Rudwick begins in the seventeenth century with Archbishop James Ussher, who famously dated the creation of the cosmos to 4004 BC. His narrative later turns to the late eighteenth and early nineteenth centuries when geological evidence was used and is still being used to reconstruct a history of the Earth that is as varied and unpredictable as human history itself. Along the way, Rudwick rejects the popular view of this story as a conflict between science and religion and shows how the modern scientific account of the Earth's deep history retains strong roots in Judeo-Christian ideas. Extensively illustrated, *Earth's Deep History* is an engaging and impressive capstone to Rudwick's distinguished career. Deftly explains how ideas of natural history were embedded in cultural history. Nature. An engaging read for nonscientists and specialists alike. Library Journal. Wonderfully erudite and absorbing. Times Literary Supplement. Fascinating, well written and novel. Essential Choice. Thrilling. London Review of Books.

Biodiversity and Earth History Jens

Boenigk, Sabina Wodniok, Edvard Glücksman, 2015-03-31 This uniquely interdisciplinary textbook explores the exciting and complex relationship between Earth's geological history and the biodiversity of life. Its innovative design provides a seamless learning experience clarifying major concepts step by step with detailed textual explanations complemented by detailed figures, diagrams, and vibrant pictures. Thanks to its layout, the respective concepts can be studied individually as part of the broader framework of each chapter or as they relate to the book as a whole. It provides in-depth coverage of Earth's formation and subsequent geological history, including patterns of climate change and atmospheric evolution. The early stages of life from microbial primordial soup theories to the fossil record's most valuable contributions. Mechanisms of mutual influence between living organisms and the environment, how life changed Earth's history whilst at the same time environmental pressures continue to shape the evolution of species. Basic ideas in biodiversity studies, species concepts, measurement techniques, and global distribution patterns. Biological systematics from their historical origins in Greek philosophy and Biblical stories to Darwinian evolution by natural selection and to phylogenetics based on cutting-edge molecular techniques. This book's four major sections offer a fresh cross-disciplinary overview of biodiversity and the Earth's history. Among many other concepts, they reveal the massive diversity of eukaryotes, explain the geological processes behind fossilisation, and provide an eye-opening account of the relatively short period of human evolution in the context of Earth's 4.6 billion-year history. Employing a combination of proven didactic tools, the book is simultaneously a reading reference, illustrated guide, and encyclopaedia of organismal biology and geology. It is aimed at school and university-level students as well as members of the public fascinated by the intricate interrelationship of living organisms and their environment. 250

Million Years of Earth History in Central Italy Christian Koeberl, David M. Bice, 2019-11-04 The Umbria-Marche Apennines are entirely made of marine sedimentary rocks representing a continuous record of the geotectonic evolution of an epeiric sea from the Early Triassic to the Pleistocene. The book includes reviews and original research works accomplished with the support of the Geological Observatory of Coldigioco.

Contesting Earth's History in Transatlantic Literary Culture, 1860-1935 Richard Fallon, 2025-02-14 By the mid-nineteenth century, geologists and palaeontologists had reconstructed an authoritative narrative of Earth's deep history from the planet's molten origins to the rise of humanity. Many figures in transatlantic science across subsequent decades, however, had problems with this narrative: it was too secular, inhuman, and evolutionary, or controlled too exclusively by elite scientists. Speaking from palaeoscience's unevenly professionalized and controversy-racked borders, Christian fundamentalists, charismatic psychics, and respected scholars alike voiced their objections. Until now, no study has brought their work together for detailed comparative analysis. Spanning from the 1860s to the interwar decades, *Contesting Earth's History* examines the fascinating stories of five significant examples of fringe or borderline palaeoscience: old and young earth creationism, hollow earth theory, clairvoyant time travel, and sunken continent catastrophism. Innovatively combining methods from literary studies with the history of science, this book attends not just to

the conceptual content of these strange sciences but also to their proponents communication of truth claims through diverse genres ranging from the scientific textbook and the technical monograph to the lost world romance and the epic poem By paying close attention to the hitherto overlooked textual forms and literary strategies of these works of pseudoscience this volume throws into relief the variant conceptions of audience evidence and method that jostled and competed in wider scientific culture during this period It also demonstrates that for all their diversity authors of borderline palaeoscience shared the desire to shift the balance of power creating textual spaces where exclusive hierarchies of scientific expertise could be levelled away These conjurors of lost worlds often captivated wide audiences and many of their bizarre astonishing and iconoclastic ideas remain with us to this day Some even inspired early science fiction by the likes of H P Lovecraft and Edgar Rice Burroughs Hijacking geologists and palaeontologists longstanding effort at making the prehistoric past visible authors on the borderlines of palaeoscience asserted their right to scientific authority and encouraged readers to gaze into time s abyss with bold new eyes

Cataclysms Michael R. Rampino, 2017-08-22 In 1980 the science world was stunned when a maverick team of researchers proposed that a massive meteor strike had wiped the dinosaurs and other fauna from the Earth 66 million years ago Scientists found evidence for this theory in a crater of doom on the Yucat n Peninsula showing that our planet had once been a target in a galactic shooting gallery In *Cataclysms* Michael R Rampino builds on the latest findings from leading geoscientists to take neocatastrophism a step further toward a richer understanding of the science behind major planetary upheavals and extinction events Rampino recounts his conversion to the impact hypothesis describing his visits to meteor strike sites and his review of the existing geological record The new geology he outlines explicitly rejects nineteenth century uniformitarianism which casts planetary change as gradual and driven by processes we can see at work today Rampino offers a cosmic context for Earth s geologic evolution in which cataclysms from above in the form of comet and asteroid impacts and from below in the form of huge outpourings of lava in flood basalt eruptions have led to severe and even catastrophic changes to the Earth s surface This new geology sees Earth s position in our solar system and galaxy as the keys to understanding our planet s geology and history of life Rampino concludes with a controversial consideration of dark matter s potential as a triggering mechanism exploring its role in heating Earth s core and spurring massive volcanism throughout geologic time
