V. Belousov,2012-12-06 Geotectonics has a special place among the geological disciplines In addition to ideas based on firmly established facts that constitute lasting scientific values geotectonics as a generalizing branch of geology embraces broad constructions that link the planet s deep interior with its surface and are largely of a hypothetical character The interpretation of the most general matters of the structure and evolution of the globe varies not only from one generation of geologists to another but even within one generation The interpretation depends not only and not so much on the state of geological knowledge as on the progress of the related sciences of geophysics and geochemistry In trying to discover the

deep lying causes of tectonic processes geotectonics has to unite the results of all the Earth sciences converting itself to some extent from a purely geological science into a general physical geographic or geonomic science The fluidity of the general ideas and the need for joint consideration of the geological geophysical and geochemical data to substantiate these ideas are the main difficulties facing the author of a textbook on geotectonics There is undoubtedly however a need for a manual of this kind particularly now when the literature on the various problems of geotectonics has grown so great and so varied in content that it is very difficult for the experienced researcher let alone the student to find his way **Active**
