well illustrated in most areas of neurobiology To formulate our questions to Nature which is the essence of experimental design methodology is needed to get answers to our questions we have to devise yet new methods The chapters of the present volume fully illustrate how the development of a new method can cut a new path how it can open new fields just as the microscope founded histology Heterogeneity of structures presents a formidable challenge for methodology in the nervous system yet methods for separating the structures are essential if we ever want to decipher the enigma of functional contribution of the elements to the whole The problem is not only physical separation clearly methods are essential to study complex structures in situ

The emergence of a new scientific book series requires some explanation regarding how it hopes to compensate the reader for the discomforts it undoubtedly produces both in the realms of informational input overload and in the financial strain on personal and institutional budgets This series recognizes that investigators who have entered neurochemistry from the biochemical tradition have a rather specialized view of the brain Too often interdisciplinary offerings are initially attractive but turn out to recite basic biochemical considerations We have come to believe that there are now sufficiently large numbers of neurochemists to support a specialized venture such as the present one We have begun with consideration of traditional areas of neurochemistry which show considerable scientific activity We hope they will serve the neurochemist both for general reading and for specialized information The reader will also have the opportunity to reflect on the unbridled speculation that results from the disinhibiting effects on the author who has been invited to write a chapter We plan occasionally also to offer reviews of areas not completely in the domain of neurochemistry which we nevertheless feel to be sufficiently timely to be called to the attention of all who use chemical

Coleman, 2005 The brain is an enormously dynamic organ Even when we sleep connections are made signals sent and  
messages delivered One of the key ways that the brain operates is via chemical stimuli which permits different parts of the  
brain to communicate between themselves and with the rest of the body Determining what these chemicals proteins and  
molecules are is an important way to not only discover how the brain works but provide novel targets that may be useful in  
the treatment of disease for instance in dealing with memory loss in dementia This new book brings together international  
research in a broad range of topics including molecular and cellular neurochemistry neuropharmacology and genetic aspects  
of CNS function neuroimmunology metabolism as well as the neurochemistry of neurological and psychiatric disorders of the
