Thangavelu, 2012-12-06 In 1932 Norbert Wiener gave a series of lectures on Fourier analysis at the University of Cambridge One result of Wiener's visit to Cambridge was his well known text *The Fourier Integral and Certain of its Applications* another was a paper by G H Hardy in the 1933 *Journal of the London Mathematical Society* As Hardy says in the introduction to this paper This note originates from a remark of Prof N Wiener to the effect that a f and g cannot both be very small The pair of transforms which follow give the most precise interpretation possible of Wiener's remark Hardy's own statement of his results lightly paraphrased is as follows in which f is an integrable function on the real line and f is its Fourier transform \hat{f} If f and \hat{f} are both $O(x^{-1/2})$ for large x and some m then each is a finite linear combination of Hermite functions In particular if f and \hat{f} are $O(x^{-2/2})$ both $O(e^{-x^2/2})$ then $f = Ae^{-x^2/2}$ where A is a constant and if one $O(x^{-2/2})$ is $O(e^{-x^2/2})$ then both are null

Complex Convexity and Analytic Functionals Mats Andersson,Mikael Passare,Ragnar Sigurdsson,2012-12-06 A set in complex Euclidean space is called C convex if all its intersections with complex lines are contractible and it is said to be linearly convex if its complement is a union of complex hyperplanes These notions are intermediates between ordinary geometric convexity and pseudoconvexity Their importance was first manifested in the pioneering work of Andr Martineau from about forty years ago Since then a large number of new related results have been obtained by many different mathematicians The present book puts the modern theory of complex linear convexity on a solid footing and gives a thorough and up to date survey of its current status Applications include the Fantappi transformation of analytic functionals integral representation formulas polynomial interpolation and solutions to linear partial differential equations
