Modulators, Mediators, and Specifiers in Brain Function Y. H. Erlich,1979 Receptors the existence of which had heretofore been largely based on hypotheses have been shown as entities which can be identified isolated and studied in the test tube The complexity of receptor function has become apparent In addition to containing binding sites for a specific neurotransmitter the receptor exists as part of a macromolecular complex the activity of which may be modulated by neuroactive peptides and mediated by the generation of cyclic nucleotides The cyclic nucleotides appear to exert their physiological effects by regulating protein phosphorylation dephosphorylation cycles Different specific phosphoproteins control metabolic events in the cell interior In addition membrane bound phosphoproteins may play a role in the regulation of receptor function and this process may be regulated by neuropeptides
