Molecular Microbial Ecology Manual A.D. Akkermans, Jan Dirk van Elsas, F.J. de Bruijn, 2012-12-06 For a long time microbial ecology has been developed as a distinct field with in Ecology In spite of the important role of microorganisms in the environment this group of invisible organisms remained unaccessible to other ecologists Detection and identification of microorganisms remain largely dependent on isolation techniques and characterisation of pure cultures We now realise that only a minor fraction of the microbial community can be cultivated As a result of the introduction of molecular methods microbes can now be detected and identified at the DNA RNA level in their natural environment This has opened a new field in ecology Molecular Microbial Ecology In the present manual we aim to introduce the microbial ecologist to a selected number of current molecular techniques that are relevant in microbial ecology The first edition of the manual contains 33 chapters and an equal number of additional chapters will be added this year Since the field of molecular ecology is in a continuous progress we aim to update and extend the Manual regularly and will invite anyone to deposit their new protocols in full detail in the next edition of this Manual

Pace, 1996 This period in microbial biology is remarkable because of our expanded access to an enormous fund of biodiversity which we only are beginning to characterize Although the chemical balance of the biosphere depends upon microorganisms we have little understanding of the makeup

and dynamics of the microbial ecosystems responsible for maintaining this balance One critical reason why our information on these matters is limited is that until recently microbial biologists usually have had to cultivate organisms to describe them However only a small portion typically far less than 1% of organisms in the environment can be cultivated by standard techniques There are many reasons for the routine failure of the usual cultivation strategies for instance unfavorable nutrients of growth conditions and intrinsic interdependencies of many organisms Techniques of recombinant DNA and molecular phylogeny now allow us to sidestep many of the limitations of cultivation and gain access to environmentmicroorganisms in relatively unbiased ways Even the limited studies thus far carried out in this arena have revealed an astounding wealth of novel organisms many profoundly different from those discovered over the past century

Aquatic Microbial Ecology Jürgen Overbeck,Ryszard J. Chrost,2012-12-06 Aquatic microbial ecology a growing interdisciplinary field has become increasingly compartmentalized in recent years The aim of this volume is to propose a framework for biochemical and molecular approaches which are employed ever more widely in studies of aquatic microbial communities and ecosystem functioning The book presents state of the art applications of modern molecular research techniques to a range of topics in ectoenzymes microbial carbon metabolism bacterial population dynamics RNA chemotaxonomy of microbial communities plasmids and adaptation to environmental conditions Written for limnologists marine biologists and all researchers interested in environmental microbiology and molecular aspects of ecology this volume will provide a stimulating introduction to this emerging field

Molecular Microbial Ecology of the Soil Gudni G. Hardarson,William J. Broughton,2013-03-09 Grain legume crops e g common bean *Phaseolus vulgaris* L and soyabeans *Glycine max* L are amongst the main sources of protein in Africa Asia and Latin America Their high protein content derive from their ability in symbiosis with *Rhizobium* bacteria to fix atmospheric nitrogen Incorporating contributions from molecular biologists microbiologists plant breeders and soil scientists this volume reports the results of an FAO IAEA Coordinated Research Programme 1992 1996 whose main objective was to develop molecular biological methods to study rhizobial ecology Use of better tracking methods will help enhance biological nitrogen fixation and thus grain legume yields while reducing their reliance on soil and or fertilizer nitrogen This volume will be invaluable to scientists working on biological nitrogen fixation soil microbial ecology and legume production

Abstract Astrobiology is a multidisciplinary topic that addresses the origin distribution and evolution of life in the universe One of the key questions relates to whether life could have evolved on other planetary bodies and Mars has been the major focus Biologists contribute to this question by studying the ecology of extreme environments on Earth that share closest analogy to Mars past or present environment In this thesis molecular level interrogations were used to address some aspects of microbial biodiversity ecology and stress tolerance in two such extreme environments The high altitude cold and intense UV irradiance of central Tibet was selected as an analogue for Mars surface today whilst cold alkaline high carbonate freshwater lakes were chosen as an analogue for Mars previous late wet phase Biological soil crusts from central Tibet supported a diverse microflora and these were variously bacteria or eukarya dominated The relatively well developed eukarya dominated crusts were characterized and showed they comprised of *Stichococcus bacillaris* plus alphaproteobacteria betaproteobacteria bacteroidetes and gemmatimonadetes In order to evaluate the diversity of radiation tolerant taxa in these soils samples were exposed to ionizing radiation and viability physiology and phylogenetic identity determined The most radio tolerant taxa isolated and characterized were from the radiation tolerant phylum Deinococci 15kGy whilst a relatively diverse range of Actinobacteria Bacilli Cyanobacteria and Proteobacteria were also recovered after exposure to doses up to 10kGy This implies the high radiation environment has selected for tolerance among diverse phyla with tolerances that far exceed environmental exposure It is not known at this stage if they all employ similar protective strategies Microbial reefs that have developed in cold alkaline lakes in British Columbia were studied as analogues for a late wet Mars environment Molecular ecological analysis revealed that communities consisted largely of of Proteobacteria alpha Cyanobacteria Leptolyngbya and Acidobacteria with similarities in community assembly to marine stromatolites Microbial diversity varied spatially and temporally within microbialites and indicated that geographically proximal structures can develop with different communities Significant changes also occur between summer and winter when the lake surface is frozen Investigation of other nearby lakes with similar geochemistry but not supporting microbialites revealed extensive microbial mats These developed in the presence of relatively high concentrations of methane or sulfate and their biodiversity reflected this with several putative methanotrophic and sulphate utilizing taxa identified No obvious cues that inhibit or promote microbialite formation were observed in this study DOI 10.5353/th_b4832999
