as entities with knowledge and goals Research on actors continued to focus on AI with the development of the Sprites model in which a monotonically growing knowledge base could be accessed by actors inspired by what Hewitt called the Scientific Computing Metaphor In the late 1970s and well into the 1980s controversy raged in AI between those arguing for declarative languages and those arguing for procedural ones Actor researchers stood on the side of a procedural view of knowledge arguing for an open systems perspective rather than the closed world hypothesis necessary for a logical declarative view In the open systems view agents had armslength relationships and could not be expected to store consistent facts nor could the information in a system be considered complete the negation as failure model Subsequent work on actors including my own focused on using actors for general purpose concurrent and distributed programming In the late 1980s a number of actor languages and frameworks were built These included Act in C by Dennis Kafura and Actalk in Smalltalk by Jean Pierre Briot In recent times the use of the Actor model in various guises has proliferated as new parallel and distributed computing platforms and applications have become common clusters Webservices P2P networks client programming on multicore processors and cloud computing
