Optical and Photographic Reconnaissance Systems Niels Jensen, 1968 *Thermal Imaging Systems* J.M.

Lloyd, 2013-06-29 This book is intended to serve as an introduction to the technology of thermal imaging and as a compendium of the conventions which form the basis of current FUR practice Those topics in thermal imaging which are covered adequately elsewhere are not treated here so there is no discussion of detectors cryogenic coolers circuit design or video displays Useful information which is not readily available because of obscure publication is referenced as originating from personal communications Virtually everyone with whom I have worked in the thermal imaging business has contributed to the book through the effects of conversations and ideas I gratefully proffer blanket appreciation to all those who have helped in that way to make this book possible The contributions of five people however bear special mention Bob Sendall Luke Biberman Pete Laakmann George Hopper and Norm Stetson They more than any others have positively influenced my thinking **Aerial Photographic Reconnaissance** United States. Remote Sensing for Environmental Sciences E. Schanda, 2012-12-06 The public's serious concern about the uncertainties and dangers of the consequences of human activities on environmental quality demands policies to control the situation and to prevent its deterioration But far reaching decisions on the environmental policy are impaired or even made impossible as long as the relevant ecological relations are not sufficiently understood and large scale quantitative information on the most important parameters is not available in sufficient quality and quantity The techniques of remote sensing offer new ways of procuring data on natural phenomena with three main advantages the large distance between sensor and object prevents interference with the environmental conditions to be measured the potentiality for large scale and even global surveys yields a new dimension for the investigations of the environmental parameters the extremely wide spectral range covered by the whole diversity of sensors discloses many properties of the environmental media not detectable within a single wave band as e.g. the visible These significant additions to the conventional methods of environmental studies and the particular qualification of several remote sensing methods for quantitative determination of the natural parameters makes this new investigation technique an important tool both to the scientists studying the ecological relationship and the administration in charge of the environmental planning and protection
