Dynamic Resource Allocation in Embedded, High-Performance and Cloud Computing Leandro Soares Indrusiak, Piotr Dziurzynski, Amit Kumar Singh, 2022-09-01 The availability of many core computing platforms enables a wide variety of technical solutions for systems across the embedded high performance and cloud computing domains However large scale manycore systems are notoriously hard to optimise Choices regarding resource allocation alone can account for wide variability in timeliness and energy dissipation up to several orders of magnitude Dynamic Resource Allocation in Embedded High Performance and Cloud Computing covers dynamic resource allocation heuristics for manycore systems aiming to provide appropriate guarantees on performance and energy efficiency It addresses different types of systems aiming to harmonise the approaches to dynamic allocation across the complete spectrum between systems with little flexibility and strict real time guarantees all the way to highly dynamic systems with soft performance requirements Technical topics presented in the book include Load and Resource Models Admission Control Feedback based Allocation and Optimisation Search based Allocation Heuristics Distributed Allocation based on Swarm Intelligence Value Based Allocation Each of the topics is illustrated with examples based on realistic computational platforms such as Network on Chip manycore processors grids and private cloud environments

Handbook of Energy-Aware and Green Computing - Two Volume Set Ishfaq Ahmad, Sanjay Ranka, 2016-02-03 Implementing energy efficient CPUs and peripherals as well as reducing resource consumption have become emerging trends in computing As computers increase in speed and power their energy issues become more and more prevalent The need to develop and promote environmentally friendly computer technologies and systems has also come to the forefront

Model-Driven Development of Reliable Automotive Services Manfred Broy, Ingolf Krüger, Michael Meisinger, 2008-07-17 Software development for the automotive domain has become the enabling technology for almost all safety critical and comfort functions offered to the customer Ninety percent of all innovations in automotive systems are directly or indirectly enabled by embedded software The numbers of serious accidents have declined in recent years despite constantly increasing traffic this is correlated with the introduction of advanced software enabled functionality for driver assistance such as electronic stability control Software contributes significantly to the automotive value chain By 2010 it is estimated that software will make up 40% of the value creation of automotive electronics However with the large number of software enabled functions their interactions and the corresponding networking and operating infrastructure come significant complexities both during the automotive systems engineering process and at

runtime A central challenge for automotive systems development is the scattering of functionality across multiple subsystems such as electronic control units ECUs and the associated networks As an example consider the central locking systems CLS whose functionality is spread out over up to 19 different ECUs in some luxury cars Of course this includes advanced functionality such as seat positioning and radio tuning according to driver presets upon entry as well as unlocking in case of a detected impact or accident However this example demonstrates that modern automotive systems bridge comfort and safety critical functionality This induces particular demands on safety and security and in general software and systems quality The resulting challenges and opportunities were discussed in depth at the second Automotive Software Workshop San Diego ASWSD 2006 on whose results we report here
