Decision Making: Recent Developments and Worldwide Applications Stelios H. Zanakis, Georgios Doukidis, Constantin Zopounidis, 2013-04-17 This chapter describes a study conducted at the Swinburne University of Technology in Australia in their School of Business The study was to explore the applicability of a judgment analytic decision support system to the assessment of the likelihood of an applicant being selected for admission to the School's Graduate Certificate in Business Administration GCBA program The likelihood of a program administrator selecting a particular applicant is directly linked to the assessment of the likelihood of that applicant's success in the GCBA program The purpose of this study in effect was to analyze the administrative judgment process in assessment of an applicant's likelihood of success in the program

THE PROCESS OF HUMAN JUDGMENT Human judgment is a process through which an individual uses social information to make decisions The social information is obtained from an individual's environment and is interpreted through the individual's cognitive image of the environment The cognitive image provides a representation of the environment based on past experiences and training and essentially predisposes the person to respond to social information in predictable ways An individual's policies or beliefs about the environment represent these patterns Human judgments are based then upon one's interpretation of available information They are probability statements about one's environment and how one reacts to it This condition leads to the human judgment process being inherently limited It is fundamentally a covert process It is seldom possible for an individual to accurately describe his or her judgment process accurately

Mathematical Theory of Optimization Ding-Zhu Du, Panos M. Pardalos, Weili Wu, 2013-03-14 Optimization is of central importance in all sciences Nature inherently seeks optimal solutions For example light travels through the shortest path and the folded state of a protein corresponds to the structure with the minimum potential energy In combinatorial optimization there are numerous computationally hard problems arising in real world applications such as floorplanning in VLSI designs and Steiner trees in communication networks For these problems the exact optimal solution is not currently real time computable One usually computes an approximate solution with various kinds of heuristics Recently many approaches have been developed that link the discrete space of combinatorial optimization to the continuous space of nonlinear optimization through geometric analytic and algebraic techniques Many researchers have found that such approaches lead to very fast and efficient heuristics for solving large problems Although almost all such heuristics work well in practice there is no solid theoretical analysis except Karmakar's algorithm for linear programming With this situation in mind we decided to teach a seminar on nonlinear optimization with emphasis on its mathematical foundations This book is

the result of that seminar During the last decades many textbooks and monographs in nonlinear optimization have been published Why should we write this new one What is the difference of this book from the others The motivation for writing this book originated from our efforts to select a textbook for a graduate seminar with focus on the mathematical foundations of optimization
