years there has been a significant increase in underwater activities such as scuba diving which coupled with the adventure and romance always associated with shipwrecks has led to rapid developments in the discovery and excavation of shipwrecked material. These shipwrecks are invaluable archaeological time capsules which in the majority of cases have come to an equilibrium with their environment. As soon as artefacts on the wreck site are moved this equilibrium is disturbed and the artefacts may commence to deteriorate sometimes in a rapid and devastating fashion. In fact excavation without having conservation facilities available is vandalism; the artefacts are much safer being left on the sea bed. Such famous shipwrecks as the Mary Rose 1545, the *Wasa* 1628 and the *Batabia* 1629 have not only brought the world's attention to these unique finds but have also produced tremendous conservation problems. The treatment of a 30 metre waterlogged wooden hull or large cast iron cannon is still causing headaches to conservators.

New Research on Hazardous Materials Phillip B. Warey, 2007
Hazardous waste is a waste with properties that make it dangerous or potentially harmful to human health or the environment. Hazardous waste generally exhibits one or more of these characteristics: ignitability, corrosivity, reactivity or toxicity. The universe of hazardous wastes is large and diverse. Hazardous wastes can be liquids, solids, contained gases or sludges. They can be the by-products of manufacturing processes or simply discarded commercial products like cleaning fluids or pesticides. One major type is radioactive waste. This book brings together the latest research in this diverse field.
