Riemannian Submersions And Related Topics:

Riemannian Submersions and Related Topics Maria Falcitelli,Anna Maria Pastore,Stere Ianus?,2004 This book provides the first ever systematic introduction to thetheory of Riemannian submersions which was initiated by BarrettO Neill and Alfred Gray less than four decades ago The authorsfocus their attention on classification theorems when the total spaceand the fibres have nice geometric properties   Riemannian Submersions and Related Topics Maria Falcitelli,Anna Maria Pastore,Stere Ianus,2004 First systematic exposition devoted to Riemannian submersions Deals with current material Contains a wide ranging bibliography and about 350 references   **Riemannian Submersions, Riemannian Maps in Hermitian Geometry, and their Applications** Bayram Sahin,2017-01-23 Riemannian Submersions Riemannian Maps in Hermitian Geometry and their Applications is a rich and self contained exposition of recent developments in Riemannian submersions and maps relevant to complex geometry focusing particularly on novel submersions Hermitian manifolds and K a hlerian manifolds Riemannian submersions have long been an effective tool to obtain new manifolds and compare certain manifolds within differential geometry For complex cases only holomorphic submersions function appropriately as discussed at length in Falcitelli Ianus and Pastore s classic 2004 book In this new book Bayram Sahin extends the scope of complex cases with wholly new submersion types including Anti invariant submersions Semi invariant submersions slant submersions and Pointwise slant submersions also extending their use in Riemannian maps The work obtains new properties of the domain and target manifolds and investigates the harmonicity and geodesicity conditions for such maps It also relates these maps with discoveries in pseudo harmonic maps Results included in this volume should stimulate future research on Riemannian submersions and Riemannian maps Systematically reviews and references modern literature in Riemannian maps Provides rigorous mathematical theory with applications Presented in an accessible reading style with motivating examples that help the reader rapidly progress   *Spectral Geometry, Riemannian Submersions, and the Gromov-Lawson Conjecture* Peter B. Gilkey,John V Leahy,JeongHyeong Park,1999-07-27 This cutting edge standard setting text explores the spectral geometry of Riemannian submersions Working for the most part with the form valued Laplacian in the class of smooth compact manifolds without boundary the authors study the relationship if any between the spectrum of Dp on Y and Dp on Z given that Dp is the p form valued Laplacian and pi Z Y is a Riemannian submersion After providing the necessary background including basic differential geometry and a discussion of Laplace type operators the authors address rigidity theorems They establish conditions that ensure that the pull back of every eigenform on Y is an eigenform on Z so the eigenvalues do not change then show that if a single eigensection is preserved the eigenvalues do not change for the scalar or Bochner Laplacians For the form valued Laplacian they show that if an eigenform is preserved then the corresponding eigenvalue can only increase They generalize these results to the complex setting as well However the spinor setting is quite different For a manifold with non trivial boundary and imposed Neumann boundary conditions the result is surprising the

eigenvalues can change Although this is a relatively rare phenomenon the authors give examples a circle bundle or more generally a principal bundle with structure group G where the first cohomology group H1 G R is non trivial They show similar results in the complex setting show that eigenvalues can decrease in the spinor setting and offer a list of unsolved problems in this area Moving to some related topics involving questions of positive curvature for the first time in mathematical literature the authors establish a link between the spectral geometry of Riemannian submersions and the Gromov Lawson conjecture Spectral Geometry Riemannian Submersions and the Gromov Lawson Conjecture addresses a hot research area and promises to set a standard for the field Researchers and applied mathematicians interested in mathematical physics and relativity will find this work both fascinating and important **Pseudo-Riemannian Geometry, [delta]-invariants and Applications** Bang-yen Chen,2011 The first part of this book provides a self contained and accessible introduction to the subject in the general setting of pseudo Riemannian manifolds and their non degenerate submanifolds only assuming from the reader some basic knowledge about manifold theory A number of recent results on pseudo Riemannian submanifolds are also included The second part of this book is on invariants which was introduced in the early 1990s by the author The famous Nash embedding theorem published in 1956 was aimed for in the hope that if Riemannian manifolds could be regarded as Riemannian submanifolds this would then yield the opportunity to use extrinsic help However this hope had not been materialized as pointed out by M Gromov in his 1985 article published in Asterisque The main reason for this is the lack of control of the extrinsic invariants of the submanifolds by known intrinsic invariants In order to overcome such difficulties as well as to provide answers for an open question on minimal immersions the author introduced in the early 1990s new types of Riemannian invariants known as invariants which are very different in nature from the classical Ricci and scalar curvatures At the same time he was able to establish general optimal relations between invariants and the main extrinsic invariants Since then many new results concerning these invariants have been obtained by many geometers The second part of this book is to provide an extensive and comprehensive survey over this very active field of research done during the last two decades **Riemannian Manifolds and Homogeneous Geodesics** Valerii Berestovskii,Yurii Nikonorov,2020-11-05 This book is devoted to Killing vector fields and the one parameter isometry groups of Riemannian manifolds generated by them It also provides a detailed introduction to homogeneous geodesics that is geodesics that are integral curves of Killing vector fields presenting both classical and modern results some very recent many of which are due to the authors The main focus is on the class of Riemannian manifolds with homogeneous geodesics and on some of its important subclasses To keep the exposition self contained the book also includes useful general results not only on geodesic orbit manifolds but also on smooth and Riemannian manifolds Lie groups and Lie algebras homogeneous Riemannian manifolds and compact homogeneous Riemannian spaces The intended audience is graduate students and researchers whose work involves differential geometry and transformation groups **Complex Geometry of Slant Submanifolds** Bang-Yen

Leahy,Jeonghyeong Park,1998 Harmonic Maps and Differential Geometry Eric Loubeau,Stefano Montaldo,2011 This volume contains the proceedings of a conference held in Cagliari Italy from September 7 10 2009 to celebrate John C Wood s 60th birthday These papers reflect the many facets of the theory of harmonic maps and its links and connections with other topics in Differential and Riemannian Geometry Two long reports one on constant mean curvature surfaces by F Pedit and the other on the construction of harmonic maps by J C Wood open the proceedings These are followed by a mix of surveys on Prof Wood s area of expertise Lagrangian surfaces biharmonic maps locally conformally Kahler manifolds and the DDVV conjecture as well as several research papers on harmonic maps Other research papers in the volume are devoted to Willmore surfaces Goldstein Pedrich flows contact pairs prescribed Ricci curvature conformal fibrations the Fadeev Hopf model the Compact Support Principle and the curvature of surfaces **Extrinsic Geometry of Foliations** Vladimir Rovenski,Paweł Walczak,2021-05-22 This book is devoted to geometric problems of foliation theory in particular those related to extrinsic geometry modern branch of Riemannian Geometry The concept of mixed curvature is central to the discussion and a version of the deep problem of the Ricci curvature for the case of mixed curvature of foliations is examined The book is divided into five chapters that deal with integral and variation formulas and curvature and dynamics of foliations Different approaches and methods local and global regular and singular in solving the problems are described using integral and variation formulas extrinsic geometric flows generalizations of the Ricci and scalar curvatures pseudo Riemannian and metric affine geometries and computable Finsler metrics The book presents the state of the art in geometric and analytical

theory of foliations as a continuation of the authors life long work in extrinsic geometry It is designed for newcomers to the field as well as experienced geometers working in Riemannian geometry foliation theory differential topology and a wide range of researchers in differential equations and their applications It may also be a useful supplement to postgraduate level work and can inspire new interesting topics to explore   Metric Foliations and Curvature Detlef Gromoll,Gerard Walschap,2009-03-28 In the past three or four decades there has been increasing realization that metric foliations play a key role in understanding the structure of Riemannian manifolds particularly those with positive or nonnegative sectional curvature In fact all known such spaces are constructed from only a representative handful by means of metric fibrations or deformations thereof This text is an attempt to document some of these constructions many of which have only appeared in journal form The emphasis here is less on the fibration itself and more on how to use it to either construct or understand a metric with curvature of fixed sign on a given space   *Extended Abstracts Fall 2013* Maria del Mar González,Paul C. Yang,Nicola Gambino,Joachim Kock,2015-11-12 The two parts of the present volume contain extended conference abstracts corresponding to selected talks given by participants at the Conference on Geometric Analysis thirteen abstracts and at the Conference on Type Theory Homotopy Theory and Univalent Foundations seven abstracts both held at the Centre de Recerca Matem tica CRM in Barcelona from July 1st to 5th 2013 and from September 23th to 27th 2013 respectively Most of them are brief articles containing preliminary presentations of new results not yet published in regular research journals The articles are the result of a direct collaboration between active researchers in the area after working in a dynamic and productive atmosphere The first part is about Geometric Analysis and Conformal Geometry this modern field lies at the intersection of many branches of mathematics Riemannian Conformal Complex or Algebraic Geometry Calculus of Variations PDE s etc and relates directly to the physical world since many natural phenomena posses an intrinsic geometric content The second part is about Type Theory Homotopy Theory and Univalent Foundations The book is intended for established researchers as well as for PhD and postdoctoral students who want to learn more about the latest advances in these highly active areas of research
