powers of the variable these series may contain exponential and logarithmic terms Over the last thirty years transseries emerged variously as super exact asymptotic expansions of return maps of analytic vector fields in connection with Tarski's problem on the field of reals with exponentiation and in mathematical physics Their formal nature also makes them suitable for machine computations in computer algebra systems This self contained book validates the intuition that the differential field of transseries is a universal domain for asymptotic differential algebra It does so by establishing in the realm of transseries a complete elimination theory for systems of algebraic differential equations with asymptotic side conditions Beginning with background chapters on valuations and differential algebra the book goes on to develop the basic theory of valued differential fields including a notion of differential henselianity Next H fields are singled out among ordered valued differential fields to provide an algebraic setting for the common properties of Hardy fields and the differential field of transseries The study of their extensions culminates in an analogue of the algebraic closure of a field the Newton Liouville closure of an H field This paves the way to a quantifier elimination with interesting consequences
