Below-Ground Interactions in Ecological Processes Oren Shelef,Philip G. Hahn,Ana Pineda,Mysore V. Tejesvi,Ainhua Martinez-Medina,2020-01-29 Aboveground interactions between plants and organisms have served as a foundation of ecological and evolutionary theories Accumulating evidence suggests that interactions that occur belowground can have immense influence on eco evolutionary dynamics of plants Despite the increasing awareness among scientists of the importance of belowground interactions for plant performance and community dynamics they have received considerably less theoretical and empirical attention compared to aboveground interactions In this eBook we aim to highlight the overlooked roles of belowground interactions and outline their myriad ecological roles from affecting soil health through impacting plant interactions with above ground fauna This eBook with 18 articles and an Editorial includes conceptual contribution together with original research work The chapters are exploring the roles of belowground biotic interactions in the context of ecological processes both below and above ground Census Catalog and Guide United States. Anaerobic Digestion Gavin Collins, Eric D. van Hullebusch, Giovanni Esposito, Cynthia Carliell-Marquet, Fernando G. Fermoso, 2018-11-27 Anaerobic digestion AD is a naturally occurring biological process in soils sediments ruminants and several other anoxic environments that cycles carbon and other nutrients and converts organic matter into a methane rich gas As a biotechnology AD is now well established for the treatment of the organic fraction of various waste materials including wastewaters but is also increasingly applied for an expanding range of organic feedstocks suitable for biological conversion to biogas AD applications are classified in various ways including on the basis of bioreactor design and operating parameters such as retention time temperature pH total solids TS and volatile solids VS contents and biodegradability of substrates AD is an attractive bioenergy and waste wastewater treatment technology The advantages of AD for waste treatment include production of a useable fuel biogas methane possibility of high organic loading reduced carbon footprint and suitability for integration into a wide variety of process configurations and scales Specifically two important and developing applications exemplify the potential of AD technologies 1 the integration of AD as the basis of the core technologies underpinning municipal wastewater and sewage treatment to displace less sustainable and more energy intensive aerobic biological treatment systems in urban water infrastructures and 2 technical innovations for higher rate conversions of high solids wastestreams and feedstocks for the production of energy carriers i.e. methane biogas but possibly also biohydrogen and other industrially relevant intermediates such as organic acids Internationally the research effort to maximize AD biogas yield has increased ten fold over the past decade Depending on the feedstocks bioreactor design and process parameters fundamental and applied knowledge are still required to improve conversion rates and biogas yields This Research Topic covers aspects related to AD processes such as the effect of feedstock composition as well as the effect of feedstock pre treatment bioreactor design and operating modes on process efficiency microbial community dynamics and systems biology influence of macro and micro nutrient concentrations and availability process control upgrading and calibration of anaerobic digestion models e.g. ADM1 considering the biochemical routes as well as the hydrodynamics in such ecosystems and novel approaches to process monitoring such as the development and application of novel and rapid diagnostic assays including those based on molecular microbiology Detailed full scale application studies were also particularly welcomed
