Numerical Methods For General And Structured Eigenvalue Problems:

Numerical Methods for General and Structured Eigenvalue Problems Daniel Kressner, 2006-01-20 This book is about computing eigenvalues eigenvectors and invariant subspaces of matrices Treatment includes generalized and structured eigenvalue problems and all vital aspects of eigenvalue computations A unique feature is the detailed treatment of structured eigenvalue problems providing insight on accuracy and efficiency gains to be expected from algorithms that take the structure of a matrix into account

Numerical Methods and Software for General and Structured Eigenvalue Problems Daniel Kreßner, 2004 *Numerical Methods and Software for General and Structured Eigenvalue Problems*

Daniel Kressner (Mathématicien), 2004 **Coping with Complexity: Model Reduction and Data Analysis** Alexander N.

Gorban, Dirk Roose, 2010-10-21 This volume contains the extended version of selected talks given at the international research workshop Coping with Complexity Model Reduction and Data Analysis Ambleside UK August 31 September 4 2009 The book is deliberately broad in scope and aims at promoting new ideas and methodological perspectives The topics of the chapters range from theoretical analysis of complex and multiscale mathematical models to applications in e g fluid dynamics and chemical kinetics

Proceedings of the Conference on Applied Mathematics and Scientific Computing Zlatko Drmac, Miljenko Marusic, Zvonimir Tutek, 2005-12-05 This book brings together contributed papers presenting new results covering different areas of applied mathematics and scientific computing Firstly four invited lectures give state of the art presentations in the fields of numerical linear algebra shape preserving approximation and singular perturbation theory Then an overview of numerical solutions to skew Hamiltonian and Hamiltonian eigenvalue problems in system and control theory is given by Benner Kressner and Mehrmann The important issue of structure preserving algorithms and structured condition numbers is discussed Costantini and Sampoli review the basic ideas of the abstract schemes and show that they can be used to solve any problem concerning the construction of spline curves subject to local constraints Kvasov presents a novel approach in solving the problem of shape preserving spline interpolation Formulating this problem as a differential multipoint boundary value problem for hyperbolic and biharmonic tension splines he considers its finite difference approximation Miller and Shishkin consider the Black Scholes equation that for some values of the parameters may be a singularly perturbed problem They construct a new numerical method on an appropriately fitted piecewise uniform mesh which is parameter uniformly convergent

Multiscale Modeling and Simulation in Science Björn Engquist, Per Lötstedt, Olof Runborg, 2009-02-11 Most problems in science involve many scales in time and space An example is turbulent flow where the important large scale quantities of lift and drag of a wing depend on the behavior of the small vortices in the boundary layer Another example is chemical reactions with concentrations of the species varying over seconds and hours while the time scale of the oscillations of the chemical bonds is of the order of femtoseconds A third example from structural mechanics is the stress and strain in a solid beam which is well described by macroscopic equations but at the tip of a crack

modeling details on a microscale are needed. A common difficulty with the simulation of these problems and many others in physics, chemistry, and biology is that an attempt to represent all scales will lead to an enormous computational problem with unacceptably long computation times and large memory requirements. On the other hand, if the discretization at a coarse level ignores the mesoscale information, then the solution will not be physically meaningful. The influence of the mesoscales must be incorporated into the model. This volume is the result of a Summer School on Multiscale Modeling and Simulation in Science held at Bosön Lidingö outside Stockholm, Sweden, in June 2007. Sixty PhD students from applied mathematics, the sciences, and engineering participated in the summer school.

Matrix Analysis and Computations Zhong-Zhi Bai, Jian-Yu Pan, 2021-09-09. This comprehensive book is presented in two parts: the first part introduces the basics of matrix analysis necessary for matrix computations, and the second part presents representative methods and the corresponding theories in matrix computations. Among the key features of the book are the extensive exercises at the end of each chapter. *Matrix Analysis and Computations* provides readers with the matrix theory necessary for matrix computations, especially for direct and iterative methods for solving systems of linear equations. It includes systematic methods and rigorous theory on matrix splitting, iteration methods, and Krylov subspace iteration methods, as well as current results on preconditioning and iterative methods for solving standard and generalized saddle point linear systems. This book can be used as a textbook for graduate students as well as a self-study tool and reference for researchers and engineers interested in matrix analysis and matrix computations. It is appropriate for courses in numerical analysis, numerical optimization, data science, and approximation theory, among other topics.

Matrix Computations Gene Howard Golub, Charles F. Van Loan, 2013-02-15. This revised edition provides the mathematical background and algorithmic skills required for the production of numerical software. It includes rewritten and clarified proofs and derivations, as well as new topics such as Arnoldi iteration and domain decomposition methods.

Informatics in Control, Automation and Robotics Oleg Gusikhin, Kurosh Madani, Janan Zaytoon, 2022-01-01. The book focuses on the latest endeavours relating researches and developments conducted in fields of Control, Robotics, and Automation. Through more than ten revised and extended articles, the present book aims to provide the most up-to-date state of art of the aforementioned fields, allowing researchers, PhD students, and engineers not only updating their knowledge but also benefiting from the source of inspiration that represents the set of selected articles of the book. The deliberate intention of editors to cover as well theoretical facets of those fields as their practical accomplishments and implementations offers the benefit of gathering in a same volume a factual and well-balanced prospect of nowadays research in those topics. A special attention toward Intelligent Robots and Control may characterize another benefit of this book.

Generalized Sylvester Equations Guang-Ren Duan, 2015-06-09. Provides One Unified Formula That Gives Solutions to Several Types of GSEs. Generalized Sylvester equations (GSEs) are applied in many fields including applied mathematics, systems and control, and signal processing. *Generalized Sylvester Equations: Unified Parametric Solutions* presents a unified

parametric approach for solving various types of GSEs
