Processing: A Quality of Service Perspective Sharma Chakravarthy,Qingchun Jiang,2009-04-09 In recent years a new

class of applications has come to the forefront primarily due to the advancement in our ability to collect data from multitudes of devices and process them efficiently. These include homeland security applications, sensor pervasive computing applications, various kinds of monitoring applications and even traditional applications belonging to financial computer network management and telecommunication domains. These applications need to process data continuously and as long as data is available from one or more sources. The sequence of data items continuously generated by sources is termed a data stream. Because of the possible never ending nature of a data stream, the amount of data to be processed is likely to be unbounded. In addition, timely detection of interesting changes or patterns or aggregations over incoming data is critical for many of these applications. Furthermore, the data arrival rates may fluctuate over a period of time and may be bursty at times. For most of these applications, Quality of Service or QoS requirements such as response time, memory usage and throughput are extremely important. These application requirements make it infeasible to simply load the incoming data streams into a persistent store and process them effectively using currently available database management techniques.
