measuring the ocean's topography with reference to an ellipsoid and for the determination of the marine geoid. Satellite altimetry has provided extremely valuable information on ocean science e.g. circulation, surface geostrophic currents, eddy structures, wave heights and the propagation of oceanic Kelvin and Rossby waves. With more than 25 years of observations it is also becoming vital to climate research, providing accurate measurements of sea level variations from regional to global scales. Altimetry has also demonstrated a strong potential for geophysical, cryospheric and hydrological research and is now commonly used for the monitoring of Arctic and Antarctic ice sheet topography and of terrestrial surface water levels. This book aims to present reviews and recent advances of general interest in the use of radar altimetry in Earth sciences. Manuscripts are related to any aspect of radar altimetry technique or geophysical applications. We also encourage manuscripts resulting from the application of new altimetric technology SAR, SARin and Ka band and improvements expected from missions to be launched in the near future i.e. SWOT.

Protecting Earth's Water Supply Ron Fridell, 2015-08-01

From roaring oceans to trickling streams, water covers seventy percent of our planet. But did you know that less than one percent of Earth's water is usable by humans? Most water on Earth is salt water. It can't be used for drinking, bathing or growing plants. We need freshwater. Yet about two thirds of Earth's freshwater is frozen solid at the North and South Poles. And the water we can access from lakes, rivers, streams, wetlands or underground sources is in danger of being polluted. There is not enough water to waste. We must join together in the quest to protect this valuable resource. With engaging text and eye catching images plus a special Going Green section, this book tells you all about Earth's water and what you can do to protect it.
