Votrubá, V. Broža, 1989-02-01 This book introduces methods for solving the technical and economic problems posed by water reservoirs so as to ensure they have the best possible economic and social effect The significance of reservoirs and the development of their function in water management is assessed and they are classified according to origin and placing Among the methods for solving the reservoir's function both graphical and numerical procedures are described based on the probability theory and mathematical statistics In the explanation of the supply function of the reservoirs attention is paid to the processing of hydrological data the respective probability distribution is assessed the theory of stochastic processes is explained and methods of modelling the sequence of mean annual and monthly discharges are mentioned The demands of consumers and the reliability of water supply are analysed All types of reservoir discharge control are presented i.e. multi year annual short term and compensation A solution is given for the discharge control in reservoir systems and in special cases of water management as well as in individual reservoirs To describe the flood control function of reservoirs hydrological data are evaluated the precision of the flood regime characteristics is assessed the flood routing in a reservoir is resolved and the question of flood control is discussed Control of a reservoir is ensured by a special space as well as by utilizing the supply and overflow components of the reservoir A separate part is devoted to the water management operations of reservoirs mentioning the rules for control of

the discharge from reservoirs in permanent operation mainly using central control and for the study and evaluation of the water management function of reservoirs The last part of the book describes solutions for new reservoir functions resulting from their incorporation into water management systems and their function in the environment The basic types of water management systems are described as well as conditions for their optimal operation In a similar way the distribution of investment and operation costs for the various parts of a complex water management project are discussed in detail as well as the economic impact of the reliability of water supply and flood control The physical chemical biological and social consequences of reservoirs and their significance in creating a cultural landscape are analysed The book is mainly intended for those who are involved in the development preparation and operation of water management schemes and students of graduate and post graduate courses in the field of water management

Mechanism Design and Management

Vladimir Burkov, 2013 Mechanism Design MD is a branch of game theory which deals with conflict situations involving a principal and a set of active agents usually in the presence of asymmetric information Mechanism design theory delivers a solution to many management problems in the form of a control mechanism i e a formalised routine of decision making Formal results of MD can change the fundamentals of managerial practice by introducing decision making mechanisms in organisations which are efficient and robust with respect to employees self serving behaviour The proposed book seeks a more intensive application of MD methodology and its formal results in organisations The main aim of the book is to provide readers with the basics of an MD based view on managerial problems so that intra firm policies can be analysed through the looking glass of employees behavioural response A systematic introduction of the underlying MD methodology is combined with a collection of ready to use mechanisms for solving typical management problems The use of MD by individual managers is facilitated by bringing together mathematical and business literature in a single treatise This book is not a purely academic monograph as it contains as few formulas as possible and no formal proofs references to formal results are provided throughout the text Courses on MD for managers are

not common in business schools now and our book represents the perfect material for such a course Mathematical Methods in Medical and Biological Sciences Harendra Singh, Hari M Srivastava, 2024-11-05 Mathematical Methods in Medical and Biological Sciences presents mathematical methods for computational models arising in the medical and biological sciences The book presents several real life medical and biological models such as infectious and non infectious diseases that can be modeled mathematically to accomplish profound research in virtual environments when the cost of laboratory expenses is relatively high It focuses on mathematical techniques that provide global solutions for models arising in medical and biological sciences by considering their long term benefits In addition the book provides leading edge developments and insights for a range of applications including epidemiological modeling of pandemic dynamics viral infection developments cancer developments blood oxygen dynamics HIV infection spread reaction diffusion models polio infection spread and chaos modeling with fractional order derivatives Presents the mathematical treatment of a wide range of real life medical and biological models including both infectious and non infectious diseases Provides in depth analysis of the spread of Covid 19 polio and HIV including discussion of computational methods and applications Includes computational modeling methods along with their practical applications providing the basis for further exploration and research in epidemiology and applied biomedical sciences **Mathematical Methods of Operations Research** Thomas L.
