Mathematical Models Of The Circadian Sleepwake Cycle:

Mathematical Models of the Circadian Sleep-wake Cycle Martin C. Moore-Ede, Charles A. Czeisler, 1984 **The Mathematical Structure of the Human Sleep-Wake Cycle** Steven H. Strogatz, 2013-03-13 Over the past three years I have grown accustomed to the puzzled look which appears on people's faces when they hear that I am a mathematician who studies sleep. They wonder but are usually too polite to ask what does mathematics have to do with sleep. Instead they ask the questions that fascinate us all: Why do we have to sleep? How much sleep do we really need? Why do we dream? These questions usually spark a lively discussion leading to the exchange of anecdotes, last night's dreams, and other personal information. But they are questions about the function of sleep and interesting as they are, I shall have little more to say about them here. The questions that have concerned me deal instead with the timing of sleep. For those of us on a regular schedule, questions of timing may seem vacuous. We go to bed at night and get up in the morning, going through a cycle of sleeping and waking every 24 hours. Yet to a large extent the cycle is imposed by the world around us.

Some Mathematical Questions in Biology Gail A. Carpenter, 1987-12-31 The articles in this collection are based on lectures given at the 20th Annual Symposium on Some Mathematical Questions in Biology held in May 1986 and sponsored jointly by the AMS, the Society for Industrial and Applied Mathematics, and Section A of the American Association for the Advancement of Science. For the past thirty years, due particularly to the fundamental work of Pittendrigh, Aschoff, and Wever, theoretical analysis of circadian rhythms and sleep have gone hand in hand with experimental and clinical studies. Circadian rhythms have been investigated at levels ranging from cell fragments to humans, from biochemistry to behavior. This experimental diversity is reflected in a diversity of modeling approaches, several of which are represented in this collection. One class of models focuses on the circadian sleep and activity cycles of humans, for which some investigators postulate pacemaker systems with two coupled oscillators, while others propose single oscillator models. Other analyses focus upon the activity patterns of small vertebrates or upon anatomical data and physiological recordings. The mathematical formulations and analyses utilize nonlinear dynamical systems, stochastic models, and computer simulations. The articles in this volume discuss, analyze, and compare these various experimental, theoretical, and mathematical approaches.

Circadian Clocks Joseph S. Takahashi, Fred W. Turek, Robert Y. Moore, 2012-12-06 The Handbook of Behavioral Neurobiology series deals with the aspects of neurosciences that have the most direct and immediate bearing on behavior. It presents the most current research available in the specific areas of sensory modalities. This volume explores circadian rhythms.

Rhythms in Physiological Systems Hermann Haken, Hans P. Koepchen, 2012-12-06 Rhythms are a basic phenomenon in all physiological systems. They cover an enormous range of frequencies with periods from the order of milliseconds up to some years. They are described by many disciplines and are investigated usually in the context of the physiology of the respective function or organ. The importance given to the research on rhythmicity is quite different in different systems. In some cases where the functional significance is obvious, rhythms are

at the center of interest as in the case of respiration or locomotion. In other fields they are considered more or less as interesting epiphenomena or at best as indicators without essential functional significance as in the case of cardiovascular or EEG rhythms. Recently the study of physiological rhythms has attracted growing interest in several fields especially with respect to rhythm research in humans and its rapidly spreading applications in basic behavioral research and as a diagnostic tool in clinical medicine. This development was favored by two methodological and conceptual advances on the one hand the availability of non-invasive methods of continuous recording of physiological parameters and their computer-assisted evaluation and on the other the rapid development of theoretical analyses for example the understanding of dynamic systems the generation of coordinated macroscopic processes in systems comprising many single elements and the mathematical tools for treating nonlinear oscillators and their mutual coupling.

The Neurosciences and the Practice of Aviation Medicine Anthony N. Nicholson, 2017-03-02 This book brings the neurosciences to operational and clinical aviation medicine. It is concerned with the physiology and pathology of circadian rhythmicity, orientation, hypotension and hypoxia and with disorders of the central nervous system relevant to the practice of aviation medicine. The chapters on circadian rhythmicity and orientation deal with the impaired alertness and sleep disturbance associated with desynchrony and with the effects of linear and angular accelerations on spatial awareness. Hypotension and hypoxia cover cerebral function during increased gravitational stress, clinical aspects of exposure to acute hypoxia, the mild hypoxia of the cabin of transport aircraft, adaptation and acclimatization to altitude and decompression at extreme altitudes and in space. Disorders of particular significance to the practice of aviation medicine such as excessive daytime sleepiness, epilepsy, syncope, hypoglycaemia, headache and traumatic brain injury are covered while neuro-ophthalmology, the vestibular system and hearing also receive detailed attention. The potentially adverse effects of the aviation environment and of disorders of the nervous system are brought together and the text covers the neurological examination as it relates to aircrew and explores current management and therapeutics. **The Neurosciences and the Practice of Aviation Medicine** is an essential work for those involved in the practice of aviation medicine where familiarity with the effects of the aviation environment on the nervous system and understanding the pathophysiology of relevant clinical disorders are of prime concern. The authors from leading centres of excellence are physiologists concerned with the aviation environment and physicians involved in the day-to-day practice of medicine. They bring to this authoritative text wide experience and expertise in both the experimental and clinical neurosciences.

Ultradian Rhythms in Life Processes David Lloyd, Ernest L. Rossi, 2012-12-06 Profound progress has been made in the fields of chronobiology and psychobiology within the past decade in theory, experiment and clinical application. This volume integrates these new developments on all levels from the molecular, genetic and cellular to the psychosocial processes of everyday life. We present a balanced variety of research from workers around the globe who discuss the fundamental significance of their approach for a new understanding of the central role of ultradian rhythms in the self-organizing and

adaptive dynamics of all life processes The years since the publication of Ultra dian rhythms in physiology and behavior by Schultz and Lavie in 1985 have seen a burgeoning realization of the ubiquity and importance of ultradian rhythms within and between every level of the psychobiological hierarchy The experimental evidence lies scattered through a disparate literature and this volume attempts albeit in a highly selective manner to bring together some of the different strands The editors are very conscious of the omission of many important current aspects e g we have not included any of the fascinating and indeed long and well established experiments with plants Bunning 1971 1977 Guillaume and Koukkari 1987 Millet et al 1988 10hnsson et al 1990 that are widely regarded as having initiated the whole field of chronobiology De Mairan 1729 Neither have we reviewed recent developments on glycolytic oscillations since a great deal of the seminal work was already completed by 1973 Chance et al 1973

Sleep—Wake Disorders K. Meier-Ewert, M. Okawa, 2013-06-29 Sleep wake disorders frequently give rise to severe ailments and varied distresses in a great number of people in the world disturbing their physical and mental activities and their social function Sleep wake disorders are now classified into a great number of cate

gories according to their clinical features and etiological factors Patients with sleep wake disorders are taken care of not only by specialists for such disorders but also by general physicians and specialists of different physical and mental disorders In the recent years the nature of sleep and sleep wake disorders have been intensively studied by investigators belonging to different fields of science including medicine biology and psychology in many countries It is very important for the progress of research that investigators working in the related fields in different countries meet together and exchange their findings and ideas The Japanese German International Symposium on Sleep Wake Disorders was held on October 9 10th 1996 in the old beautiful city of Erfurt Germany This symposium was organized by Professor Karlheinz Meier Ewert Schwalmstadt Germany and Dr Masako Okawa Ichikawa Japan with support of the German Society of Sleep Research President at that time Professor J H Peter and of the Japanese Society of Sleep Research President at that time Professor Y Hishikawa

who retired at that time from his position as the Director of the Max Planck Institute of Psychiatry in Munich The lectures represent an overview of the scientific work conducted at the Max Planck Institute within the recent past and thus also reflect the scientific intentions and research strategies of Detlev Ploog who brought together extremely divergent tendencies within basic and clinical research and integrated the findings to elucidate new perspectives for fundamental psychiatric problems His ability to combine topics such as brain and behavior with neuropsychological neuroethological psychopharmacological and behavioral aspects generated a scientific climate in which psychiatric research flourished The chapters in the present volume represent a documentation of this integrative view on psychiatry and we who worked together with Detlev Ploog as his university colleagues at the Ludwig Maximilians University H H the Technical University of Munich H L and as his successor at the Max Planck Institute F H wish him also after his retirement continued scientific success with many additional contributions to modern psychiatry Hanns Hippus Florian Holsboer Hans Lauter Preface One of the main purposes of science is to elaborate models of natural processes that should be as realistic as possible

Psychobiology Of Mind Body Healing Revised Edition Ernest Lawrence Rossi,1993-11-02 Rossi examines new evidence from psychoneuroimmunology neuroendocrinology molecular genetics and neurobiology and shows how we can utilize these natural processes to facilitate our emotional and physical well being More than a dozen new approaches to Many of the hypotheses that Rossi proposed when this book was published in 1986 have now been confirmed The mind body connection is a process that can be seen measured and accessed through hypnosis In establishing that it is possible to use the mind to heal body illness he now brings together new evidence from psychoneuroimmunology neuroendocrinology molecular genetics and neurobiology More than a dozen new approaches to mind body healing are outlined in a series of teaching tutorials

Blackman,Helga Lejeune,2013-05-24 This edited book addresses four themes of contemporary importance in the experimental and applied analysis of behaviour chronobiology relationships between time and behaviour the emergence of rational thinking language and behavioural medicine The

current empirical and theoretical status of each theme is considered in individual chapters the authors of which are distinguished research scientists drawn from a wide range of scholarship and with a distinctive European dimension This cultural and theoretical diversity emerges from the fact that each chapter is developed from a paper originally presented by invitation at the Second European Meeting on the Experimental Analysis of Behaviour which was held in Li ge Belgium in 1988 Within the four themes individual topics address issues such as circadian rhythms in behaviour temporal regulation in children and in animals the emergence of equivalence relations in children and animals the development of thinking in mentally retarded children reasoning and associative learning in animals rule governed behaviour theoretical issues relating language to the theory of mind the relationship between behavioural and visceral functions the relevance of behavioural approaches to the prevention of AIDS and the development of self detection skills for breast cancer The book makes an important contribution to the literature of contemporary behaviour analysis by reviewing issues of current interest and importance from a broad theoretical base National Library of Medicine Current Catalog National Library of Medicine (U.S.), **Local Aspects of Sleep and Wakefulness** Giulio Bernardi,Francesca Siclari,Michele Bellesi,2020-03-24
