Sedimentary Geology At Meridiani Planum Mars:

Sedimentary Geology at Meridiani Planum, Mars S.W. Squyres, Andrew H. Knoll, 2006-01-17 In January of 2004 twin robotic explorers Spirit and Opportunity landed on Mars Expected to last for 90 days the two rovers explored the Martian surface for nearly two years Their objective was to search for evidence of ancient water on Mars and to determine if Mars ever had conditions that would have been suitable for life Opportunity landed on Meridiani Planum a smooth plateau near the Martian equator coming to rest in a small impact feature named Eagle Crater After leaving Eagle Crater Opportunity drove eastward to Endurance Crater a much larger crater that allowed access to deeper and older rocks At these locations Opportunity found strong evidence for ancient water on Mars This evidence includes blueberries small concretions rich in hematite that precipitated from water Other evidence includes rocks that were made largely of sulphate salts deposited when water evaporated and rocks that preserve ancient ripples that formed billions of years ago as water flowed over sand on Mars The conditions long ago at Meridiani Planum could have been suitable for some simple forms of life Whether life could have developed there however is a more difficult question

Comparative Climatology of Terrestrial Planets Stephen J. Mackwell, Amy A. Simon-Miller, Jerald W. Harder, Mark A. Bullock, 2014-01-25 The early development of life a fundamental question for humankind requires the presence of a suitable planetary climate Our understanding of how habitable planets come to be begins with the worlds closest to home Venus Earth and Mars differ only modestly in their mass and distance from the Sun

yet their current climates could scarcely be more divergent Only Earth has abundant liquid water Venus has a runaway greenhouse and evidence for life supporting conditions on Mars points to a bygone era In addition an Earth like hydrologic cycle has been revealed in a surprising place Saturn s cloud covered satellite Titan has liquid hydrocarbon rain lakes and river networks Deducing the initial conditions for these diverse worlds and unraveling how and why they diverged to their current climates is a challenge at the forefront of planetary science Through the contributions of more than sixty leading experts in the field Comparative Climatology of Terrestrial Planets sets forth the foundations for this emerging new science and brings the reader to the forefront of our current understanding of atmospheric formation and climate evolution Particular emphasis is given to surface atmosphere interactions evolving stellar flux mantle processes photochemistry and interactions with the interplanetary environment all of which influence the climatology of terrestrial planets From this cornerstone both current professionals and most especially new students are brought to the threshold enabling the next generation of new advances in our own solar system and beyond

Lakes on Mars Nathalie A. Cabrol,Edmond A. Grin,2010-09-15 On Earth lakes provide favorable environments for the development of life and its preservation as fossils They are extremely sensitive to climate fluctuations and to conditions within their watersheds As such lakes are unique markers of the impact of environmental changes Past and current missions

have now demonstrated that water once flowed at the surface of Mars early in its history. Evidence of ancient ponding has been uncovered at scales ranging from a few kilometers to possibly that of the Arctic ocean. Whether life existed on Mars is still unknown; upcoming missions may find critical evidence to address this question in ancient lakebeds as clues about Mars climate evolution and its habitability potential are still preserved in their sedimentary record. *Lakes on Mars* is the first review on this subject. It is written by leading planetary scientists who have dedicated their careers to searching and exploring the questions of water lakes and oceans on Mars through their involvement in planetary exploration and the analysis of orbital and ground data beginning with Viking up to the most recent missions. In thirteen chapters, *Lakes on Mars* critically discusses new data and explores the role that water played in the evolution of the surface of Mars: the past hydrological provinces of the planet, the possibility of heated lake habitats through enhanced geothermal flux associated with volcanic activity and impact cratering. The book also explores alternate hypotheses to explain the geological record. Topographic, morphologic, stratigraphic, and mineralogic evidence are presented that suggest successions of ancient lake environments in Valles Marineris and Hellas. The existence of large lakes and/or small oceans in Elysium and the Northern Plains is supported both by the global distribution of deltaic deposits and by equipotential surfaces that may reflect their past margins. Whether those environments were conducive to life has yet to be demonstrated, but from comparison with our planet, their sedimentary deposits may provide the best opportunity to find its record, if any. The final chapters explore the impact of climate variability on declining lake habitats in one of the closest terrestrial analogs to Mars at the Noachian/Hesperian transition, identify the geologic, morphologic, and mineralogic signatures of ancient lakes to be searched for on Mars, and present the case for landing the Mars Science Laboratory mission in such an environment. First review on the subject by worldwide leading authorities in the field. New studies with most recent data, new images, figures, and maps. Most recent results from research in terrestrial analogs.

Treatise on Geophysics, Volume 10 Tilman Spohn, 2010-05-20. *Planets and Moons* covers topics relating to the physics of the major planetary bodies in the solar system, starting with an introductory description of the solar system and collection of pertinent data, continuing with a discussion of the early history of the planets and finishing with articles about planet dynamics, thermal evolution of planets and satellites, and descriptions of their magnetic fields and the processes that generate them. In addition to providing a review on the solid planets and the satellites, this volume addresses the interactions of solid surfaces and atmospheres, as well as the roles of water and ice in shaping the surfaces of planetary bodies. Self-contained volume starts with an overview of the subject, then explores each topic with in-depth detail. Extensive reference lists and cross-references with other volumes to facilitate further research. Full-color figures and tables support the text and aid in understanding. Content suited for both the expert and non-expert.

From Habitability to Life on Mars Nathalie A. Cabrol, Edmond A. Grin, 2018-06-29 From

Habitability to Life on Mars explores the current state of knowledge and questions on the past habitability of Mars and the role that rapid environmental changes may have played in the ability of prebiotic chemistry to transition to life. It investigates the role that such changes may have played in the preservation of biosignatures in the geological record and what this means for exploration strategies. Throughout the book the authors show how the investigation of terrestrial analogs to early Martian habitats under various climates and environmental extremes provide critical clues to understand where, what and how to search for biosignatures on Mars. The authors present an introduction to the newest developments and state of the art remote and in situ detection strategies and technologies that are being currently developed to support the upcoming ExoMars and Mars 2020 missions. They show how the current orbital and ground exploration is guiding the selection for future landing sites. Finally the book concludes by discussing the critical question of the implications and ethics of finding life on Mars.

Edited by the lead on a NASA project that searches for habitability and life on Mars leading to the Mars 2020 mission. Presents the evidence, questions and answers we have today including a summary of the current state of knowledge in advance of the ESA ExoMars and NASA Mars 2020 missions. Includes contributions from authors directly involved in past, current and upcoming Mars missions. Provides key information as to how Mars rovers such as ExoMars and Mars 2020 will address the search for life on Mars with their instrumentation.

Fundamentals of Geobiology Andrew H. Knoll, Don E. Canfield, Kurt O. Konhauser, 2012-03-30 2012 PROSE Award Earth Science Honorable Mention. For more than fifty years scientists have been concerned with the interrelationships of Earth and life. Over the past decade however, geobiology, the name given to this interdisciplinary endeavour, has emerged as an exciting and rapidly expanding field fuelled by advances in molecular phylogeny, a new microbial ecology made possible by the molecular revolution, increasingly sophisticated new techniques for imaging and determining chemical compositions of solids on nanometer scales, the development of non-traditional stable isotope analyses, Earth systems science and Earth system history, and accelerating exploration of other planets within and beyond our solar system. Geobiology has many faces: there is the microbial weathering of minerals, bacterial and skeletal biomineralization, the roles of autotrophic and heterotrophic metabolisms in elemental cycling, the redox history in the oceans and its relationship to evolution, and the origin of life itself. This book is the first to set out a coherent set of principles that underpin geobiology and will act as a foundational text that will speed the dissemination of those principles. The chapters have been carefully chosen to provide intellectually rich but concise summaries of key topics and each has been written by one or more of the leading scientists in that field. *Fundamentals of Geobiology* is aimed at advanced undergraduates and graduates in the Earth and biological sciences, and to the growing number of scientists worldwide who have an interest in this burgeoning new discipline.
