written with the aim of compiling from modern environments information that can be useful in the reconstruction of ancient  
environments It is intended for all those interested in recognizing depositional environments The study of sediments includes  
investigations of various aspects of sediments This needs a study by standard methods Methods of study have not been  
included as many textbooks exist on the subject However the importance of various results obtained from such investigations  
has been discussed as far as these results can be helpful in environmental reconstruction Special attention is given to  
information that has accumulated during the last decades on the mode of genesis of various sedimentary features and their  
distribution in present day environments As far as possible existing terminology has been used However in several cases  
new simple groupings and classifications have been proposed In making classification generally the form and shape of the  
features have been considered so that they can be applied easily to ancient sediments At the same time the genesis of such  
features has been noted and genetic names and their characteristics have been given for detailed work The subject is so vast  
that several primary sedimentary features that have no direct bearing on environmental interpretation have been omitted  
The subject is vast and numerous publications are available      Memorias, 1972      **Recent Sediments, Northwest Gulf of**

Laboratory, 1972      Recent Sedimentary Carbonates J.D. Milliman, G. Müller, F. Förstner, 2012-12-06 Few fields of research  
in the earth sciences have produced as much data and literature as the study of carbonate sediments and rocks The past 25  
years in particular have seen a significant increase in studies concerning modern marine and fresh water carbonates With

the present worldwide interest in oceanographic research marine carbonates have received the bulk of the attention particularly with respect to shallow water sediments However in terms of the variety of environments compositions and modes of formation non marine carbonates probably encompass a wider spectrum than do marine types Our purpose is to present a two volume treatise on carbonate sediments and rocks both marine and non marine We have confined ourselves to the discussion of modern Holocene environments sediments and components assuming that the compilation of these data will not only be relevant to those working with modern carbonates but will also serve as a necessary reference source for those interested in ancient analogs The first volume by MILLIMAN deals almost exclusively with marine environments while the second volume by MULLER and FORSTNER will concentrate on the non marine carbonates **Geological Survey**
