Mathematical Methods Of Population Biolo:

Mathematical Methods of Population Biology Frank Charles Hoppensteadt, 1982-02-26 An introduction to mathematical methods used in the study of population phenomena including models of total population and population age structure models of random population events presented in terms of Markov chains and methods used to uncover qualitative behavior of more complicated difference equations Mathematical Methods of Population Biology William Brandon, 1976

Introduction to Mathematical Methods in Population Theory Jacek Banasiak, 2024-12-20 This textbook provides an introduction to the mathematical methods used to analyse deterministic models in life sciences including population dynamics epidemiology and ecology The book covers both discrete and continuous models The presentation emphasises the solvability of the equations appearing in the mathematical modelling of natural phenomena and in the absence of solutions the analysis of their relevant properties Of particular interest are methods that allow for determining the long term behaviour of solutions Thus the book covers a range of techniques from the classical Lyapunov theorems and positivity methods based on the Perron Frobenius theorem to the more modern monotone dynamical system approach The book offers a comprehensive presentation of the Lyapunov theory including the inverse Lyapunov theorems with applications to perturbed equations and Vidyasagar theorem Furthermore it provides a coherent presentation of the foundations of the theory of monotone dynamical systems with its applications to epidemiological models Another feature of the book is the derivation of the McKendrick von Foerster equation from the discrete Leslie model and the analysis of the long term behaviour of its solutions Designed for upper undergraduate courses and beyond this textbook is written for students and researchers looking to master the mathematics of the tools commonly used to analyse life science models It therefore goes somewhat deeper into mathematics than typical books at this level but should be accessible to anyone with a good command of calculus with elements of real and complex analysis and linear algebra the necessary concepts are collected in the appendices **Statistical and Mathematical Methods in Population Dynamics** R. Cavalloro, 1984-06-01 Modelling and

Rose,2012-12-06 This is an inadvertent book though it did arise naturally enough from a course I give in theoretical ecology But I wouldn t have given

the course at all if one colleague in my department hadn't left for a leave of absence while another abruptly resigned. This propelled me to the fore where this teaching responsibility was concerned. One I had never had any intention of discharging. Then it turned out that one of my students was regularly unable to make half the classes. As a result I began giving him my lecture notes each week. As I knew that someone else would be reading them I began to write my notes more carefully. Naturally enough the other students soon began to demand the notes too. Eventually they were indulged. Thus I found myself writing a textbook manuscript. By the next year the students were handed all their notes in one package at the outset. But these were still just hand written. Inevitably the demand that they be typed arose. This I didn't want to do until I found a publisher. As it turned out Tim Hardwick of Croom Helm was willing to have his firm fill this role to my great satisfaction and his considerable frustration. I have been a desultory author about producing this final text and can only express my gratitude for his enduring patience over more than 18 months of delays.

Biological Invasions: Theory and Practice Nanako

Shigesada, Kohkichi Kawasaki, 1997-02-06 This book deals with the ecological effect a species can have when it moves into an environment that it has not previously occupied commonly referred to as an Invasion. It is unique in presenting a clear and accessible introduction to a highly complex area the modelling of biological invasions. The book presents the latest theories and models developed from studies into this crucial area. It includes data and examples from biological case studies showing how the models can be applied to the study of invasions whether dealing with AIDS the European rabbit or prickly pear cactuses. In nature all organisms migrate or disperse to some extent either by walking swimming flying or being transported by wind or water. When a species succeeds in colonising an area that it has not previously inhabited this is referred to as an invasion. Humans can precipitate biological invasions often spreading disease or pests by their travels around the world. Using the large amount of data that has been collected from studies worldwide ranging from pest control to epidemiology it has been possible to construct mathematical models that can predict which species will become an invader what kind of habitat is susceptible to invasion by a particular species and how fast an invasion will spread if it occurs. This book presents a clear and accessible introduction to this highly complex area. Included are data and examples from biological case studies showing how these models can be applied to the study of invasions whether dealing with AIDS the European rabbit or prickly pear cactuses.

Population Ecology Michael Begon, Martin Mortimer, David J. Thompson, 2009-07-15 Worldwide

Population Ecology is the leading textbook on this titled subject. Written primarily for students it describes the present state of population ecology in terms that can be readily understood by undergraduates with little or no background in the subject. Carefully chosen experimental examples illustrate each topic and studies of plants and animals are combined to show how fundamental principles can be derived that apply to both species. Use of complex mathematics is avoided throughout the book and what math is necessary is dealt with by examination of real experimental data rather than dull theory. The latest edition of this leading textbook. Adopted as an Open University set text.
