Mathematical Tools In Production Management:

Mathematical Tools in Production Management Jean-Marie Proth, Herve P. Hillion, 1990-07-31 The authors of this book have been in charge of over thirty industrial contracts of various length from six months to three years the companies involved covered a wide range of industrial activities including steel making hot and cold rolling aerospace research automobile manufacturing chemical manufacturing coal mining bronze casting and mechanical engineering All contracts were related to problems connected either with the preliminary design of production systems or with the management of these systems The problems that the authors investigated involved not only designing and scheduling but also the modeling analysis and evaluation of production systems The book is based to a large extent on the experience gained in working on these contracts and the mathematical procedures presented are those that have been applied during the course of work on at least one of the contracts Moreover the authors have always kept in mind an idea which seems pivotal in the world of industry the difficulty in companies lies much more in determining the exact nature of a problem and defining the criteria to be taken into account than in solving the problem itself

Supply Chain Engineering Alexandre Dolgui, Jean-Marie Proth, 2010-06-02. Supply Chain Engineering considers how modern production and operations management techniques can respond to the pressures of the competitive global marketplace. It presents a comprehensive analysis of concepts and models related to outsourcing, dynamic pricing, inventory management, RFID and flexible and reconfigurable manufacturing systems, as well as real time assignment and scheduling processes. A significant part is also devoted to lean manufacturing, line balancing, facility layout and warehousing techniques. Explanations are based on examples and detailed algorithms while discarding complex and unnecessary theoretical minutiae. All examples have been carefully selected from an industrial application angle. This book is written for students and professors in industrial and systems engineering, management science, operations management and business. It is also an informative reference for managers looking to improve the efficiency and effectiveness of their production systems.

Advances in Production Management Systems: New Challenges, New Approaches Bruno Vallespir, Thècle

Alix,2010-10-19 The present economic and social environment has given rise to new situations within which companies must operate As a first example the globalization of the economy and the need for performance has led companies to outsource and then to operate inside networks of enterprises such as supply chains or virtual enterprises A second instance is related to environmental issues The statement about the impact of industrial activities on the environment has led companies to revise processes to save energy to optimize transportation A last example relates to knowledge Knowledge is considered today to be one of the main assets of a company How to capitalize to manage to reuse it for the benefit of the company is an important current issue The three examples above have no direct links However each of them constitutes a challenge that companies have to face today This book brings together the opinions of several leading researchers from all around the world Together they try to develop new approaches and find answers to those challenges Through the individual chapters of this book the authors present their understanding of the different challenges the concepts on which they are working the approaches they are developing and the tools they propose The book is composed of six parts each one focuses on a specific theme and is subdivided into subtopics

Balanced Automation Systems Luis M. Camarinha-Matos,Hamideh Afsarmanesh,2013-06-05 Towards Balanced Automation The concept Manufacturing industries worldwide are facing tough challenges as a consequence of the globalization of economy and the openness of the markets Progress of the economic blocks such as the European Union NAFTA and MERCOSUR and the global agreements such as GATT in addition to their obvious economic and social consequences provoke strong paradigm shifts in the way that the manufacturing systems are conceived and operate To increase profitability and reduce the manufacturing costs there is a recent tendency towards establishing partnership links among the involved industries usually between big industries and the networks of components suppliers To benefit from the advances in technology similar agreements are being established between industries and universities and research institutes Such an open tete cooperation network may be identified as an extended enterprise or a virtual enterprise In fact the manufacturing process is no more carried out by a single enterprise rather each enterprise is just a node that adds some value a step in the manufacturing chain to the cooperation network of enterprises The new trends create new scenarios and technological challenges especially to the Small and Medium size Enterprises SMEs that clearly

comprise the overwhelming majority of manufacturing enterprises worldwide Under the classical scenarios these SMEs would have had big difficulties to access or benefit from the state of the art technology due to their limited human financial and material resources

Technological Concepts and Mathematical Models in the Evolution of Modern Engineering Systems Mario Lucertini, Ana Millàn Gasca, Fernando Nicolò, 2012-12-06 M LUCERTINI A MILLAN GASCA AND F NICOLÒ 1 Technology as Knowledge The Case of Modern Engineering Systems In recent years scholars coming from the fields of history and philosophy of science and technology have devoted much attention to the problem of technology as knowledge and to the emergence of an autonomous engineering science in the Industrial Age This interest echoes a growing awareness among engineers of the independence of their conceptual approach with respect to other forms of knowledge linked to the consolidation of autonomous academic engineering research in the 20th century A careful examination of the nature of technological knowledge appears particularly valuable in view of the pervasive presence of technology in contemporary life and culture not only as a result of its impressive achievements but through the less obvious influence of its concepts and viewpoints as well The activity of engineers and technicians has been traditionally based on the practical ability to cope with specific situations and to attain the corresponding specific goal by means of the design and realization of an artifact or structure on the basis of past experience handed down by tradition and applied by means of trial and error and rule of thumb procedures But the existence of a theoretical background and of principles underpinning this activity can be traced back to classical antiquity
