Mathematical modelling and electrophysiological monitoring of the regulation of cochlear amplification Greg A. O'Beirne, 2005-08-30 The cochlea presumably possesses a number of regulatory mechanisms to maintain cochlear sensitivity in the face of disturbances to its function Evidence for such mechanisms can be found in the time course of the recovery of CAP thresholds during experimental manipulations and in observations of slow oscillations in cochlear micromechanics following exposure to low frequency tones the bounce phenomenon and other perturbations To increase our understanding of these oscillatory processes within the cochlea and OHCs in particular investigations into cochlear regulation were carried out using a combination of mathematical modelling of the ionic and mechanical interactions likely to exist within the OHCs and electrophysiological experiments conducted in guinea pigs The electrophysiological experiments consisted of electrocochleographic recordings and in some cases measurement of otoacoustic emissions during a variety of experimental perturbations including the application of force to the cochlear wall exposure to very low frequency tones injection of direct current into scala tympani and intracochlear perfusions of artificial perilymph containing altered concentrations of potassium sodium and sucrose To obtain a panoramic view of cochlear regulation under these conditions software was written to enable the interleaved and near simultaneous measurement of multiple indicators of cochlear function including the compound action potential CAP threshold amplitude and waveshape at multiple frequencies the OHC transfer curves derived from low frequency cochlear microphonic CM waveforms distortion product otoacoustic emissions DPOAEs the spectrum of the round window neural noise SNN and the endocochlear potential EP The mathematical model takes into account the known electrical properties of OHC and includes the effect of fast and slow motility of the cell body on transducer operating point and apical conductance Central to the operation of the model is a putative intracellular 2nd messenger system based on cytosolic calcium which is involved in regulation of i the operating point of OHC MET channels via slow motility and axial stiffness ii the permeability of the basolateral wall to potassium via calcium sensitive potassium channels and iii the cytosolic concentration of calcium itself via modulation of its own sequestration into and release from intracellular storage organelles and extrusion from the cell The model was constructed in a manner which allowed simulation of different cochlear perturbations and the comparison of results from these simulations to experimental data The mathematical model we have developed provided a physiologically plausible and internally consistent explanation for the time courses of the cochlear

changes observed during a number of different perturbations We show that much of the oscillatory behaviour within the cochlea is consistent with underlying oscillations in cytosolic calcium concentration We conclude that a number of the discrepancies between the simulation results and the experimental data can be resolved if the cytosolic calcium functions as two distinct pools one which controls basolateral permeability and one which controls slow motility This two calcium pool model is discussed Mathematical and Numerical Modeling of the Cardiovascular System and Applications Daniele Boffi, Luca F. Pavarino, Gianluigi Rozza, Simone Scacchi, Christian Vergara, 2018-11-03 The book comprises contributions by some of the most respected scientists in the field of mathematical modeling and numerical simulation of the human cardiocirculatory system It covers a wide range of topics from the assimilation of clinical data to the development of mathematical and computational models including with parameters as well as their efficient numerical solution and both in vivo and in vitro validation It also considers applications of relevant clinical interest This book is intended for graduate students and researchers in the field of bioengineering applied mathematics computer computational and data science and medicine wishing to become involved in the highly fascinating task of modeling the cardiovascular system Mathematics for Large Scale Computing Julio Diaz, 2020-06-29 During recent years a great deal of interest has been devoted to large scale computing applications This has occurred in great part because of the introduction of advanced high performance computer architectures The book contains survey articles as well as chapters on specific research applications development and analysis of numerical algorithms and performance evaluation of algorithms on advanced architectures The effect of specialized architectural features on the performance of large scale computation is also considered by several authors Several areas of applications are represented including the numerical solution of partial differential equations iterative techniques for large structured problems the numerical solution of boundary value problems for ordinary differential equations numerical optimization and numerical quadrature Mathematical issues in computer architecture are also presented including the description of grey codes for generalized hypercubes The results presented in this volume give in our opinion a representative picture of today's state of the art in several aspects of large scale computing Cardiac Electrophysiology Methods and Models Paul A.
