**Non-Invasive Characterization of Liver Disease** Markus Karlsson, 2019-12-13 There is a large and unmet need for diagnostic tool that can be used to characterize chronic liver diseases CLD In the earlier stages of CLD much of the diagnostics involves performing biopsies which are evaluated by a histopathologist for the presence of e g fat iron inflammation and fibrosis Performing biopsies however have two downsides i biopsies are invasive and carries a small but non negligible risk for serious complications ii biopsies only represents a tiny portion of the liver and are thus prone to sampling error Moreover in the later stages of CLD when the disease has progressed far enough the ability of the liver to perform its basic function will be compromised In this stage there is a need for better methods for accurately measuring liver function Additionally measures of liver function can also be used when developing new drugs as biomarkers for drug induced liver injury DILI which is a serious drug safety issue Magnetic resonance imaging MRI is a non invasive medical imaging

modality which have shown much promise with regards to characterizing liver disease in all of the abovementioned aspects. The aim of this PhD project was to develop and validate MR based methods that can be used to non invasively characterize liver disease. Paper I investigated if R2 mapping a MR method for measuring liver iron content can be confounded by liver fat. The results show fat does affect R2. The conclusion was therefore that fat must be taken into account when measuring small amounts of liver iron as a small increase in R2 could be due to either small amounts of iron or large amounts of fat. Paper II examined whether T1 mapping which is another MR method can be used for staging liver fibrosis. The results of previous research have been mixed some studies have been very promising whereas other studies have been less promising. Unfortunately the results in Paper II belongs to the less promising studies. Paper III focused on measuring liver function by dynamic contrast enhanced MRI DCEMRI using a liver specific contrast agent which is taken up by the hepatocytes and excreted to the bile. The purpose of the paper was to extend and validate a method for estimating uptake and efflux rates of the contrast agent. The method had previously only been applied in healthy volunteers. Paper II showed that the method can be applied to CLD patients and that the uptake of the contrast agent is lower in patients with advanced fibrosis. Paper IV also used studied liver function with DCE MRI in patients with primary sclerosing cholangitis. PSC is a CLD where the bile ducts are attacked by the immune system. When diagnosing PSC patients it is common to use magnetic resonance cholangiopancreatography MRCP which is a method for imaging the bile ducts. Paper IV examined if there was any correlation between number and severity of the morphological changes seen on MRCP and measures of liver function derived using DCE MRI. However the results showed no such correlation. The conclusion was that the results indicates that MRCP should not be used to predict parenchymal function. Paper V developed a method for translating DCE MRI liver function parameters from rats to humans. This translation could be of value when developing new drugs as a tool for predicting which drugs might cause drug induced liver injury. In summary this thesis has shown that multimodal quantitative MR has a bright future for characterizing liver disease from a range of different aspects.

Quantitative Magnetic Resonance Imaging Nicole Seiberlich, Vikas Gulani, Adrienne Campbell-Washburn, Steven Sourbron, Mariya Ivanova Doneva, Fernando Calamante, Houchun Harry Hu, 2020-11-18. Quantitative Magnetic Resonance Imaging is a go to reference for methods and applications of quantitative magnetic resonance imaging with specific sections on Relaxometry, Perfusion and Diffusion. Each section will start with an explanation of the basic techniques for mapping the tissue property in question including a description of the challenges that arise when using these basic approaches. For properties which can be measured in multiple ways each of these basic methods will be described in separate chapters. Following the basics a chapter in each section presents more advanced and recently proposed techniques for quantitative tissue property mapping with a concluding chapter on clinical applications. The reader will learn the basic physics behind tissue property mapping. How to implement basic pulse sequences for the quantitative measurement of tissue properties. The strengths and limitations to the basic and
