

Magnetohydrodynamic flow in rectangular ducts. II

By J. C. R. HUNT

AND K. STEWARTSON

Department of Mathematics, University College London

(Received 26 April 1965)

This paper is an extension of an earlier paper by Hunt (1965) on laminar motion of a conducting liquid in a rectangular duct under a uniform transverse magnetic field. The effects of the duct having conducting walls are further explored; in this case the duct considered has perfectly conducting walls parallel to the field and non-conducting walls perpendicular to the field. A solution is obtained for high Hartmann numbers by analysing the boundary layers on the walls. This solution involves an integral equation of a standard form.

It is found that in this case, unlike the cases studied in the earlier paper, the velocity profiles in the boundary layers are monotonically decreasing. The effect of an external electrical circuit is examined, although it is found that it does not influence the form of the velocity profiles.

1. Introduction

The fully-developed laminar flow of uniformly conducting and incompressible fluids through ducts under the action of a transverse magnetic field is attracting considerable interest at the present time, mainly for two reasons.

First, magnetohydrodynamic generators, pumps and accelerators are devices of practical importance in which conducting fluids are passed through transverse magnetic fields. The analysis of the flow in these devices is formidable for one may have to take into account the variable conductivity and density of the fluid, complicated potential drops between the electrodes and the fluid and the fact that the flow is usually turbulent. In order to make progress in the understanding of the phenomena therefore, considerable simplification is necessary which may take various forms, e.g. (a) an assumption of slug flow (Neuringer & Migotsky 1963), (b) a reduction of the problem to one-dimensional gas dynamics (Resler & Sears 1958), (c) a two-dimensional analysis of the development of the laminar boundary layer on the walls in the direction of the flow (Kerrebrock 1961; Hale & Kerrebrock 1964), (d) a two-dimensional analysis of the flow down the duct assuming that it is inviscid (Sutton & Carlson 1961), or (e) the form used in the present paper, two-dimensional analysis of the flow variation across the duct assuming that it is laminar, fully developed and that there is no variation of fluid properties throughout the duct. These various idealizations are comple-
