AI work and are there parallels to the human brain What do natural and artificial intelligence have in common and what are the differences Is the brain nothing more than a biological computer What are neural networks and how can the term deep learning be explained simply Since the cognitive revolution in the middle of the last century AI and brain research have been closely intertwined There have been several spectacular breakthroughs in the field of AI in recent years from alphaGo to DALL E 2 and ChatGPT which were completely unthinkable until recently However researchers are already working on the innovations of tomorrow such as hybrid machine learning or neuro symbolic AI But what does this actually mean Based on current research findings and exciting practical examples this non fiction book provides an understandable introduction to the basics and challenges of these fascinating disciplines You will learn what neuroscience and psychology know about how the brain works and how artificial intelligence works You will also learn how AI has revolutionized our understanding of the brain and how findings from brain research are used in computer science to further develop AI algorithms Discover the fascinating world of these two disciplines Find out why artificial intelligence and brain research are two sides of the same coin and how they will shape our future

The Self-Assembling Brain Peter Robin Hiesinger, 2022-12-13 In this book Peter Robin Hiesinger explores historical and contemporary attempts to understand the information needed to make biological and artificial neural networks Developmental neurobiologists and computer scientists with an interest in artificial intelligence driven by the promise and resources of biomedical research on the one hand and by the promise and advances of computer technology on the other are trying to understand the fundamental principles that guide the generation of an intelligent system Yet though researchers in these disciplines share a common interest their perspectives and approaches are often quite different The book makes the case that the information problem underlies both fields driving the questions that are driving forward the frontiers and aims to encourage cross disciplinary communication and understanding to help both fields make progress The questions that challenge researchers in these fields include the following How does genetic information unfold during the years long process of human brain development and can this be a short cut to create human level artificial intelligence Is the biological brain just messy hardware that can be improved upon by running learning algorithms in computers Can artificial intelligence bypass evolutionary programming of grown networks These questions are tightly linked and answering them requires an understanding of how information unfolds algorithmically to generate functional neural networks Via a series of closely linked discussions fictional dialogues between researchers in different disciplines and pedagogical seminars the author explores the different challenges facing researchers working on neural networks their different perspectives and approaches as well as the common ground and understanding to be found amongst those sharing an interest in the development of biological brains and artificial intelligent systems

The Brain Jean-Pierre Changeux, Gerald M. Edelman, 2017-11-30 One of the vastly exciting areas in modern science involves the study of the brain Recent research focuses not only on how the brain works but how it is related to what we normally call the mind and throws

new light on human behavior Progress has been made in researching all that relates to interior man why he thinks and feels as he does what values he chooses to adopt and what practices to scorn All of these attributes make us human and help to explain art philosophy and religions Motion sight and memory as well as emotions and the sentiments common to humans are all given new meaning by what we have learned about the brain In an introductory essay Vernon B Mountcastle traces the progress made in brain science during this century Gerald M Edelman touches upon features of the brain that challenge the picture of the brain as a machine Semir Zeki discusses artists and artistic expression as an extension of the function of the brain Richard S J Frackowiak probes the functional architecture of the brain Mark F Bear and Leon N Cooper explore whether complex neural systems can be illuminated by theoretical structures Jean Pierre Changeux sheds light on the knowledge gained in recent years concerning the neurobiology and pharmacology of drug action and addiction Alexander A Borbully and Giulio Tononi ponder the quest for the essence of sleep illuminating its complex dynamic process George L Gabor Miklos examines variations in neuroanatomies and sensory systems between individuals of the same species as well as variations across the evolutionary spectrum Emilio Bizzi and Ferdinando A Mussa Ivaldi explain how scientists have approached the study of movement the problems encountered and the solutions proposed Marcel Kinsbourne explores the unity and diversity in the human brain In the concluding essay Andy Clark points to recent work in neuroscience robotics and psychology that stresses the unexpected intimacy of brain body and world supporting his belief that the mind is best understood as a brain at home in its proper bodily cultural and environmental niche The breadth and scope of subjects covered in this volume attest to the extraordinary progress taking place in the study of the brain This brilliant collection of essays by those at the forefront of research in this area will be of interest to all those interested in human behavior Gerald M Edelman is director of the Neurosciences Institute and chairman of the Department of Neurobiology at the Scripps Research Institute Jean Pierre Changeux is professor at the Collège de France and the Institut Pasteur

Biomimetic Neural Learning for Intelligent Robots Stefan Wermter, Günther Palm, Mark Elshaw, 2005-08-25 This state of the art survey contains selected papers contributed by researchers in intelligent systems cognitive robotics and neuroscience including contributions from the MirrorBot project and from the NeuroBotics Workshop 2004 The research work presented demonstrates significant novel developments in biologically inspired neural models for use in intelligent robot environments and biomimetic cognitive behavior
