I of the Vortex Rodolfo R. Llinas,2002-02-22 A highly original theory of how the mind brain works based on the author s study of single neuronal cells In I of the Vortex Rodolfo Llinas a founding father of modern brain science presents an original view of the evolution and nature of mind According to Llinas the mindness state evolved to allow predictive interactions

between mobile creatures and their environment He illustrates the early evolution of mind through a primitive animal called the sea squirt The mobile larval form has a brainlike ganglion that receives sensory information about the surrounding environment As an adult the sea squirt attaches itself to a stationary object and then digests most of its own brain This suggests that the nervous system evolved to allow active movement in animals To move through the environment safely a creature must anticipate the outcome of each movement on the basis of incoming sensory data Thus the capacity to predict is most likely the ultimate brain function One could even say that Self is the centralization of prediction At the heart of Llinas's theory is the concept of oscillation Many neurons possess electrical activity manifested as oscillating variations in the minute voltages across the cell membrane On the crests of these oscillations occur larger electrical events that are the basis for neuron to neuron communication Like cicadas chirping in unison a group of neurons oscillating in phase can resonate with a distant group of neurons This simultaneity of neuronal activity is the neurobiological root of cognition Although the internal state that we call the mind is guided by the senses it is also generated by the oscillations within the brain Thus in a certain sense one could say that reality is not all out there but is a kind of virtual reality
