The Action Plan for Australian Mammals 2012 Andrew Burbidge, John Woinarski, Peter Harrison, 2014-06-02 The Action Plan for Australian Mammals 2012 is the first review to assess the conservation status of all Australian mammals It complements The Action Plan for Australian Birds 2010 Garnett et al 2011 CSIRO Publishing and although the number of Australian mammal taxa is marginally fewer than for birds the proportion of endemic extinct and threatened mammal taxa is far greater These authoritative reviews represent an important foundation for understanding the current status fate and future of the nature of Australia This book considers all species and subspecies of Australian mammals including those of external territories and territorial seas For all the mammal taxa about 300 species and subspecies considered Extinct Threatened Near Threatened or Data Deficient the size and trend of their population is presented along with information on geographic range and trend and relevant biological and ecological data The book also

presents the current conservation status of each taxon under Australian legislation what additional information is needed for managers and the required management actions Recovery plans where they exist are evaluated The voluntary participation of more than 200 mammal experts has ensured that the conservation status and information are as accurate as possible and allowed considerable unpublished data to be included All accounts include maps based on the latest data from Australian state and territory agencies from published scientific literature and other sources The Action Plan concludes that 29 Australian mammal species have become extinct and 63 species are threatened and require urgent conservation action However it also shows that where guided by sound knowledge management capability and resourcing and longer term commitment there have been some notable conservation success stories and the conservation status of some species has greatly improved over the past few decades The Action Plan for Australian Mammals 2012 makes a major contribution to the conservation of a wonderful legacy that is a significant part of Australia s heritage For such a legacy to endure our society must be more aware of and empathetic with our distinctively Australian environment and particularly its marvellous mammal fauna relevant information must be readily accessible environmental policy and law must be based on sound evidence those with responsibility for environmental management must be aware of what priority actions they should take the urgency for action and consequences of inaction must be clear and the opportunity for hope and success must be recognised It is in this spirit that this account is offered

Quantitative Methods for Conservation Biology Scott Ferson,Mark Burgman,2006-05-09 Quantitative methods are needed in conservation biology more than ever as an increasing number of threatened species find their way onto international and national red lists Objective evaluation of population decline and extinction probability are required for sound decision making Yet as our colleague Selina Heppell points out population viability analysis and other forms of formal risk assessment are underused in policy formation because of data uncertainty and a lack of standardized methodologies and unambiguous criteria i e rules of thumb Models used in conservation biology range from those that are purely heuristic to some that are highly predictive Model selection should be dependent on the questions being asked and the data that are available We need to develop a toolbox of quantitative methods that can help scientists and managers with a wide range of systems and that are subject to varying levels of data uncertainty and environmental variability The methods outlined in the following chapters represent many of the tools needed to fill that toolbox When used in conjunction with adaptive management they should provide information for improved monitoring risk assessment and evaluation of management alternatives The first two chapters describe the application of methods for detecting trends and extinctions from sighting data Presence absence data are used in general linear and additive models in Chapters 3 and 4 to predict the extinction proneness of birds and to build
