Recent Trends In Combinatorics:

Recent Trends in Combinatorics Andrew Beveridge, Jerrold R. Griggs, Leslie Hogben, Gregg Musiker, Prasad Tetali, 2016-04-12 This volume presents some of the research topics discussed at the 2014 2015 Annual Thematic Program Discrete Structures Analysis and Applications at the Institute for Mathematics and its Applications during Fall 2014 when combinatorics was the focus. Leading experts have written surveys of research problems making state of the art results more conveniently and widely available. The three part structure of the volume reflects the three workshops held during Fall 2014. In the first part topics on extremal and probabilistic combinatorics are presented, part two focuses on additive and analytic combinatorics and part three presents topics in geometric and enumerative combinatorics. This book will be of use to those who research combinatorics directly or apply combinatorial methods to other fields. **Recent Trends in Combinatorics**

Ervin Győrfi, Vera Sós, 2001-04-05 This collection of surveys and research papers on recent topics of interest in combinatorics is dedicated to Paul Erdős who attended the conference and who is represented by two articles in the collection including one unfinished which he was writing on the eve of his sudden death. Erdős was one of the greatest mathematicians of his century and often the subject of anecdotes about his somewhat unusual lifestyle. A new preface written by friends and colleagues gives a flavor of his life including many such stories and also describes the broad outline and importance of his work in combinatorics and other related fields. *Recent Trends in Algebraic Combinatorics* Hélène Barcelo, Gizem Karaali, Rosa Orellana, 2019-01-21 This edited volume features a curated selection of research in algebraic combinatorics that explores the boundaries of current knowledge in the field. Focusing on topics experiencing broad interest and rapid growth, invited contributors offer survey articles on representation theory, symmetric functions, invariant theory, and the combinatorics of Young tableaux. The volume also addresses subjects at the intersection of algebra, combinatorics, and geometry, including the study of polytopes, lattice points, hyperplane arrangements, crystal graphs, and Grassmannians. All surveys are written at an introductory level that emphasizes recent developments and open problems. An interactive tutorial on Schubert Calculus emphasizes the geometric and topological aspects of the topic and is suitable for combinatorialists as well as geometrically minded researchers seeking to gain familiarity with relevant combinatorial tools. Featured authors include prominent women in the field known for their exceptional writing of deep mathematics in an accessible manner. Each article in this volume was reviewed independently by two referees. The volume is suitable for graduate students and researchers interested in algebraic combinatorics. **Recent Trends in Algebraic Combinatorics** Hélène Barcelo, Gizem Karaali, Rosa Orellana, 2019 This edited volume features a curated selection of research in algebraic combinatorics that explores the boundaries of current knowledge in the field. New Trends in Quantum Integrable Systems Boris Feigin, Michio Jimbo, Masato Okado, 2010-10-29 The present volume is the result of the international workshop on New Trends in Quantum Integrable Systems that was held in Kyoto Japan from 27 to 31 July 2009 As a continuation of the RIMS Research Project Method of Algebraic Analysis in Integrable Systems in 2004 the workshop's aim was to cover exciting new developments that have emerged during the recent years Collected here are research articles based on the talks presented at the workshop including the latest results obtained thereafter The subjects discussed range across diverse areas such as correlation functions of solvable models integrable models in quantum field theory conformal field theory mathematical aspects of Bethe ansatz special functions and integrable differential difference equations representation theory of infinite dimensional algebras integrable models and combinatorics Through these topics the reader is exposed to the most recent developments in the field of quantum integrable systems and related areas of mathematical physics

Current Trends on Monomial and Binomial Ideals Huy Tài Hà, Takayuki Hibi, 2020-03-18 Historically the study of monomial ideals became fashionable after the pioneering work by Richard Stanley in 1975 on the upper bound conjecture for spheres On the other hand since the early 1990s under the strong influence of Gröbner bases binomial ideals became gradually fashionable in commutative algebra The last ten years have seen a surge of research work in the study of monomial and binomial ideals Remarkable developments in for example finite free resolutions syzygies Hilbert functions toric rings as well as

cohomological invariants of ordinary powers and symbolic powers of monomial and binomial ideals have been brought forward. The theory of monomial and binomial ideals has many benefits from combinatorics and Gröbner bases. Simultaneously, monomial and binomial ideals have created new and exciting aspects of combinatorics and Gröbner bases. In the present Special Issue, particular attention was paid to monomial and binomial ideals arising from combinatorial objects including finite graphs, simplicial complexes, lattice polytopes, and finite partially ordered sets, because there is a rich and intimate relationship between algebraic properties and invariants of these classes of ideals and the combinatorial structures of their combinatorial counterparts. This volume gives a brief summary of recent achievements in this area of research. It will stimulate further research that encourages breakthroughs in the theory of monomial and binomial ideals. This volume provides graduate students with fundamental materials in this research area. Furthermore, it will help researchers find exciting activities and avenues for further exploration of monomial and binomial ideals. The editors express our thanks to the contributors to the Special Issue. Funds for APC article processing charge were partially supported by JSPS Japan Society for the Promotion of Science Grants in Aid for Scientific Research S entitled "The Birth of Modern Trends on Commutative Algebra and Convex Polytopes with Statistical and Computational Strategies" JP 26220701. Pattern Recognition on Oriented Matroids Andrey O. Matveev, 2017-09-11. *Pattern Recognition on Oriented Matroids* covers a range of innovative problems in combinatorics, poset and graph theories, optimization, and number theory that constitute a far-reaching extension of the arsenal of committee methods in pattern recognition. The groundwork for the modern committee theory was laid in the mid 1960s when it was shown that the familiar notion of solution to a feasible system of linear inequalities has ingenious analogues which can serve as collective solutions to infeasible systems. A hierarchy of dialects in the language of mathematics, for instance, open cones in the context of linear inequality systems, regions of hyperplane arrangements, and maximal covectors or topes of oriented matroids, provides an excellent opportunity to take a fresh look at the infeasible system of homogeneous strict linear inequalities, the standard working model for the contradictory two-class pattern recognition problem in its geometric setting. The universal language of oriented matroid theory considerably simplifies a structural and enumerative analysis of applied aspects of the infeasibility phenomenon. The present book is devoted to several selected topics in the emerging theory of pattern recognition on oriented matroids: the questions of existence and applicability of matroidal generalizations of committee decision rules and related graph-theoretic constructions to oriented matroids with very weak restrictions on their structural properties; a study in which, in particular, interesting subsequences of the Farey sequence appear naturally; the hierarchy of the corresponding tope committees; a description of the three tope committees that are the most attractive approximation to the notion of solution to an infeasible system of linear constraints; an application of convexity in oriented matroids as well as blocker constructions in combinatorial optimization and in poset theory to enumerative problems on tope committees; an attempt to clarify how
