data To meet this challenge knowledge discovery and data mining KDD is growing rapidly as an emerging field However no matter how powerful computers are now or will be in the future KDD researchers and practitioners must consider how to manage ever growing data which is ironically due to the extensive use of computers and ease of data collection with computers Many different approaches have been used to address the data explosion issue such as algorithm scale up and data reduction Instance example or tuple selection pertains to methods or algorithms that select or search for a representative portion of data that can fulfill a KDD task as if the whole data is used Instance selection is directly related to data reduction and becomes increasingly important in many KDD applications due to the need for processing efficiency and or storage efficiency One of the major means of instance selection is sampling whereby a sample is selected for testing and analysis and randomness is a key element in the process Instance selection also covers methods that require search Examples can be found in density estimation finding the representative instances data points for a cluster boundary hunting finding the critical instances to form boundaries to differentiate data points of different classes and data squashing producing weighted new data with equivalent sufficient statistics Other important issues related to instance selection extend to unwanted precision focusing concept drifts noise outlier removal data smoothing etc Instance Selection and Construction for Data Mining brings researchers and practitioners together to report new developments and applications to share hard learned experiences in order to avoid similar pitfalls and to shed light on the future development of instance selection This volume serves as a comprehensive reference for graduate students practitioners and researchers in KDD *Social Security Bulletin* ,2009
