On The Origin Of Species:

On the Origin of Species Charles Darwin, 2019 On the Origin of Species is the great work of Darwin's life. The whole first edition of 1250 copies was exhausted on the day of issue. The first four chapters explain the operation of artificial selection by man and of natural selection in consequence of the struggle for existence. The fifth chapter deals with the laws of variation and causes of modification other than natural selection. The five succeeding chapters consider difficulties in the way of a belief in evolution generally as well as in natural selection. The three remaining chapters, omitting the recapitulation which occupies the last, deal with the evidence for evolution. The theory which suggested a cause of evolution is thus given the foremost place and the evidence for the existence of evolution considered last of all. The Origin of Species Charles Darwin, 1958-04-01 With an Introduction by Jeff Wallace. A grain in the balance will determine which individual shall live and which shall die. Darwin's theory of natural selection issued a profound challenge to orthodox thought and belief. No being or species has been specifically created; all are locked into a pitiless struggle for existence with extinction looming for those not fitted for the task. Yet The Origin of Species 1859 is also a humane and inspirational vision of ecological interrelatedness, revealing the complex mutual interdependencies between animal and plant life, climate and physical environment, and by implication within the human world. Written for the general reader in a style which combines the rigour of science with the subtlety of literature, The Origin of Species remains one of the founding documents of the modern age. On the Origin of Species Charles Darwin, 2016-02-22 INTRODUCTION When on board H.M.S. Beagle as naturalist, I was much struck with certain facts in the distribution of the inhabitants of South America and in the geological relations of the present to the past inhabitants of that continent. These facts seemed to me to throw some light on the origin of species; that mystery of mysteries as it has been called by one of our greatest philosophers. On my return home it occurred to me in 1837 that something might perhaps be made out on this question by patiently accumulating and reflecting on all sorts of facts which could possibly have any bearing on it. After five years' work I allowed myself to speculate on the subject and drew up some short notes. These I enlarged in 1844 into a sketch of the conclusions which then seemed to me probable from that period to the present day. I have steadily pursued the same object. I hope that I may be excused for entering on these personal details as I give them to show that I have not been hasty in coming to a decision. My work is now nearly finished, but as it will take me two or three more years to complete it and as my health is far from strong I have been urged to publish this Abstract. I have more especially been induced to do this as Mr Wallace, who is now studying the natural history of the Malay archipelago, has arrived at almost exactly the same general conclusions that I have on the origin of species. Last year he sent to me a memoir on this subject with a request that I would forward it to Sir Charles Lyell, who sent it to the Linnean Society and it is published in the third volume of the Journal of that Society. Sir C. Lyell and Dr Hooker, who both knew of my work, the latter having read my sketch of 1844, honoured me by thinking it advisable to publish with Mr Wallace's excellent memoir some

brief extracts from my manuscripts I much regret that want of space prevents my having the satisfaction of acknowledging the generous assistance which I have received from very many naturalists some of them personally unknown to me I cannot however let this opportunity pass without expressing my deep obligations to Dr Hooker who for the last fifteen years has aided me in every possible way by his large stores of knowledge and his excellent judgment In considering the Origin of Species it is quite conceivable that a naturalist reflecting on the mutual affinities of organic beings on their embryological relations their geographical distribution geological succession and other such facts might come to the conclusion that each species had not been independently created but had descended like varieties from other species Nevertheless such a conclusion even if well founded would be unsatisfactory until it could be shown how the innumerable species inhabiting this world have been modified so as to acquire that perfection of structure and coadaptation which most justly excites our admiration Naturalists continually refer to external conditions such as climate food etc as the only possible cause of variation In one very limited sense as we shall hereafter see this may be true but it is preposterous to attribute to mere external conditions the structure for instance of the woodpecker with its feet tail beak and tongue so admirably adapted to catch insects under the bark of trees In the case of the misseltoe which draws its nourishment from certain trees which has seeds that must be transported by certain birds and which has flowers with separate sexes absolutely requiring the agency of certain insects to bring pollen from one flower to the other it is equally preposterous to account for the structure of this parasite with its relations to several distinct organic beings by the effects of external conditions or of habit or of the volition of the plant itself The author of the Vestiges of Creation would I presume say that after a certain unknown number of generations some bird had given birth to a woodpecker and some plant to the misseltoe and that these had been produced perfect as we now see them but this assumption seems to me to be no explanation for it leaves the case of the coadaptations of organic beings to each other and to their physical conditions of life untouched and unexplained
