**Diseases of the Spinal Cord** Sir Byrom Bramwell, 1886

Development of the Human Spinal Cord Joseph Altman, Shirley Ann Bayer, 2001 There exists a wealth of information about the development of the spinal cord in journal articles and monographs yet this beautifully illustrated work is the first book devoted to this important topic Because the developing human spinal cord cannot be subjected to experimental manipulations the knowledge gained from experimental work in animals is applied here to an interpretation of the time course and mechanisms of spinal cord development in man The book begins with a review of our current understanding of the structure and functions of the spinal cord Special reference is made to the phylogeny of the vertebrate spinal cord because the authors interpretation of the development and organization of the human spinal cord is specifically an evolutionary one Following a detailed experiment based account of spinal cord development in the rat the development of the human spinal cord is described illustrated and interpreted in separate chapters during three epochs the first trimester the embryonic period the second and third trimesters the fetal period and the first year of postnatal life Special attention is paid to such topics as neurons and the growth and myelination of the ascending and descending fiber tracts of the spinal cord The book ends with a correlation of the development of motor behavior with different stages in the morphological development of the human spinal cord during the embryonic fetal and postnatal periods The successive acquisition of voluntary control over different parts of the body during infancy is correlated with the progressive myelination of the corticospinal tract The book contains an extensive review of work on spinal cord organization and development throughout the 20th century The interpretations are based on experimental studies of spinal cord development in the rat carried out by the authors and their associates The histological material on human spinal cord development is the largest ever assembled and reproduced combining the Carnegie Minot and Yakovlev Collections The collected material which varies in quality and some of it has begun to fade has been digitized and electronically reprocessed for improved reproduction Discrete components of the spinal cord and new developments are highlighted by color coding typically on one side only leaving the contralateral side untouched to allow the reader to use his own interpretation Summary graphs are presented many in color to convey important structural relationships developmental events or theories The authors revive a few forgotten theories and offer several new ones regarding the development and organization of the human spinal cord Development of the Human Spinal

**Skull Traction and Cervical Cord Injury** Alf Breig, 2013-06-29 In this book on the optimal treatment of the injured spinal cord we present the reasons why we consider it necessary to handle trauma sized medullary tissue in accordance with the classical biological principles of wound healing in general namely by long term tension free immobilization of the spinal cord Today such immobilization for this purpose can only be achieved by surgical securement of slight dorsiflexion of the cervical spine Traumatically compressed medullary tissue is invariably attenuated and weakened On application of skull traction the weakened section of the compressed cervical cord is the part that is most overstretched This inevitably results in increased neurological deficit On scrutiny of the clinical records of 100 tetraplegic patients treated by skull traction at the National Spinal Injuries Centre at the Stoke Mandeville Hospital Aylesbury England from 1971 to 1982 we found that therapeutic skull traction had been followed by an immediate increase in neurological deficit in 12% of the patients a relatively high figure for the type of case in which beneficial effects of traction were habitually anticipated Moreover in studies on cadavers artificial defects in fresh human cervical cord in situ showed typical deformation following application of traction confirming the basic deleterious effects of therapeutic skull traction on the injured cervical cord *Spinal Cord and Spinal Column Tumors* Curtis A. **Sensory Mechanisms of the Spinal Cord** William D. Willis, Richard E. Coggeshall, 1991-07-31 This monograph thoroughly examines the latest theory and research concerning spinal cord mechanisms of sensory processing The book begins with a historical review of the organization of the peripheral nervous system is outlined in terms of sensory receptors and primary afferent axons The authors examine the dorsal horn and the structure and function of dorsal horn interneurons and neurophysiological evidence concerning the location of sensory pathways in the spinal cord white matter After the dorsal column dorsal lateral fasciculus and the ventral quadrant are covered the final chapter summarizes knowledge on receptors and spinal cord pathways of various sensations including touch pressure flutter vibration pain temperature position sense visceral sensation and descending control systems
