Loop Parallelization:

Loop Parallelization Utpal Banerjee, 2013-06-29 Automatic transformation of a sequential program into a parallel form is a subject that presents a great intellectual challenge and promises a great practical award. There is a tremendous investment in existing sequential programs and scientists and engineers continue to write their application programs in sequential languages primarily in Fortran. The demand for higher speedups increases. The job of a restructuring compiler is to discover the dependence structure and the characteristics of the given machine. Much attention has been focused on the Fortran do loop. This is where one expects to find major chunks of computation that need to be performed repeatedly for different values of the index variable. Many loop transformations have been designed over the years and several of them can be found in any parallelizing compiler currently in use in industry or at a university research facility. The book series on KappaLoop Transformations for Restructuring Compilers provides a rigorous theory of loop transformations and dependence analysis. We want to develop the transformations in a consistent mathematical framework using objects like directed graphs, matrices, and linear equations. Then the algorithms that implement the transformations can be precisely described in terms of certain abstract mathematical algorithms. The first volume, Loop Transformations for Restructuring Compilers: The Foundations, provided the general mathematical background needed for loop transformations, including those basic mathematical algorithms discussed, data dependence, and introduced the major transformations. The current volume, Loop Parallelization, builds a detailed theory of iteration level loop transformations based on the material developed in the previous book.

Automatic Parallelization Samuel Midkiff, 2022-06-01 Compiling for parallelism is a longstanding topic of compiler research. This book describes the fundamental principles of compiling regular numerical programs for parallelism. We begin with an explanation of analyses that allow a compiler to understand the interaction of data reads and writes in different statements and loop iterations during program execution. These analyses include dependence analysis, use-def analysis, and pointer analysis. Next, we describe how the results of these analyses are used to enable transformations that make loops more amenable to parallelization and discuss transformations that expose parallelism to target shared memory, multicore, and vector processors. We then discuss some problems that arise when parallelizing programs for execution on distributed memory machines. Finally, we conclude with an overview of solving Diophantine equations and suggestions for further readings in the topics of this book to enable the interested reader to delve deeper into the field. Table of Contents: Introduction and overview; Dependence analysis: dependence graphs and alias analysis; Program parallelization: Transformations to modify and eliminate dependences; Transformation of iterative and recursive constructs; Compiling for distributed memory machines; Solving Diophantine equations; A guide to further reading.

Symbolic Parallelization of Nested Loop Programs Alexandru-Petru Tanase, Frank Hannig, Jürgen Teich, 2018-02-22 This book introduces new compilation techniques using the polyhedron model for the resource adaptive parallel execution of loop programs on

massively parallel processor arrays The authors show how to compute optimal symbolic assignments and parallel schedules of loop iterations at compile time for cases where the number of available cores becomes known only at runtime The compile runtime symbolic parallelization approach the authors describe reduces significantly the runtime overhead compared to dynamic or just in time compilation The new on demand fault tolerant loop processing approach described in this book protects loop nests for parallel execution against soft errors

Chapman,2005-01-25 This book contains the Proceedings of the 5th Workshop on OpenMP Applications and Tools WOMPAT2004 which took place at the University of Houston Houston Texas on May 17 and 18 2004 Previous workshops in this series took place in Toronto Canada Fairbanks Alaska Purdue Indiana and San Diego California The purpose of the workshop was to bring together users and developers of the OpenMP API for shared memory parallel

programming to disseminate their ideas and experiences and discuss the latest developments in OpenMP and its application. To support this aim the program comprised a mixture of invited talks from research and industry experience reports and submitted papers the last of which are presented in this volume. A tutorial introduction to OpenMP was held at the same location on May 18 by Ruud van der Pas from Sun Microsystems. Further a two day lab session called OMPlab was held immediately following the workshop and the tutorial on May 19 and 20 and was attended by both novice and advanced users. Many of the hardware vendors and several researchers gave in depth tutorials on their software and made their systems available to both novice and advanced attendees during OMPlab.

Contributors to the WOMPAT 2004 OMPlab included IBM, Intel, Sun, the University of Tennessee, NASA, the University of Greenwich, Cornell University, the University of Oregon and the University of Houston. The OpenMP API is a widely accepted standard for high level shared memory parallel programming that was put forth by a consortium of vendors in 1997.

Both algorithms and the software and hardware of automatic computers have gone through a rapid development in the past 35 years The dominant factor in this development was the advance in computer technology Computer parameters were systematically improved through electron tubes transistors and integrated circuits of ever increasing integration density which also influenced the development of new algorithms and programming methods Some years ago the situation in computers development was that no additional enhancement of their performance could be achieved by increasing the speed of their logical elements due to the physical barrier of the maximum transfer speed of electric signals Another enhancement of computer performance has been achieved by parallelism which makes it possible by a suitable organization of n processors to obtain a performance increase of up to n times Research into parallel computations has been carried out for several years in many countries and many results of fundamental importance have been obtained Many parallel computers have been designed and their algorithmic and programming systems built Such computers include ILLIAC IV DAP STARAN OMEN STAR 100 TEXAS INSTRUMENTS ASC CRAY 1 C mmp CM CLIP 3 PEPE This trend is supported by the fact that a many algorithms and programs are highly parallel in their structure b the new LSI and VLSI technologies have allowed processors to be combined into large parallel structures c greater and greater demands for speed and reliability of computers are made **Euro-Par 2002.
