Beam Shaping and Control with Nonlinear Optics F. Kajzar, R. Reinisch, 1998-04-30 The field of nonlinear optics which has undergone a very rapid development since the discovery of lasers in the early sixties continues to be an active and rapidly developing search area The interest is mainly due to the potential applications of nonlinear optics rectly in telecommunications for high rate data transmission image processing and

recognition or indirectly from the possibility of obtaining large wavelength range tuneable lasers for applications in industry medicine biology data storage and retrieval etc New phenomena and materials continue to appear regularly renewing the field This has proven to be especially true over the last five years New materials such as organics have been developed with very large second and third order nonlinear optical responses Important developments in the areas of photorefractivity all optical phenomena frequency conversion and electro optics have been observed In parallel a number of new phenomena have been reported some of them challenging the previously held concepts For example solitons based on second order nonlinearities have been observed in photorefractive materials and frequency doubling crystals destroying the perception that third order nonlinearities are required for their generation and propagation New ways of creating and manipulating nonlinear optical materials have been developed An example is the creation of highly nonlinear second order active polymers by static electric field photo assisted or all optical poling Nonlinear optics involves by definition the product of electromagnetic fields As a consequence it leads to the beam control
