Handbook of Nonlinear Partial Differential Equations, Second Edition Andrei D. Polyanin, Valentin F. Zaitsev, 2016-04-19
New to the Second Edition More than 1 000 pages with over 1 500 new first second third fourth and higher order nonlinear equations with solutions Parabolic hyperbolic elliptic and other systems of equations with solutions Some exact methods and transformations Symbolic and numerical methods for solving nonlinear PDEs with MapleTM Mathematica and MATLAB Many new illustrative examples and tables A large list of references consisting of over 1 300 sources To accommodate different mathematical backgrounds the authors avoid wherever possible the use of special terminology They outline the methods in a schematic simplified manner and arrange the material in increasing order of complexity

Handbook of Differential Equations: Evolutionary Equations C.M. Dafermos, Eduard Feireisl, 2005-10-05 The aim of this Handbook is to acquaint the reader with the current status of the theory of evolutionary partial differential equations and with some of its applications Evolutionary partial differential equations made their first appearance in the 18th century in the endeavor to understand the motion of fluids and other continuous media The active research effort over the span of two centuries combined with the wide variety of physical phenomena that had to be explained has resulted in an enormous body of literature Any attempt to produce a comprehensive survey would be futile The aim here is to collect review articles written by leading experts which will highlight the present and expected future directions of development of the field The emphasis will be on nonlinear equations which pose the most challenging problems today Volume I of this Handbook does focus on the abstract theory of evolutionary equations Volume 2 considers more concrete problems relating to specific applications Together they provide a panorama of this amazingly complex and rapidly developing branch of mathematics

Handbook of Mathematical Fluid Dynamics S. Friedlander, D. Serre, 2003-03-27 The Handbook of Mathematical Fluid Dynamics is a compendium of essays that provides a survey of the major topics in the subject Each article traces developments surveys the results of the past decade discusses the current state of knowledge and presents major future directions and open problems Extensive bibliographic material is provided The book is intended to be useful both to experts in the field and to mathematicians and other scientists who wish to learn about or begin research in mathematical fluid dynamics The Handbook illuminates an exciting subject that involves rigorous mathematical theory applied to an important physical problem namely the motion of fluids

Probability Theory and Combinatorial Optimization J. Michael Steele, 1997-01-01 This monograph provides an introduction to the state of the art of the probability theory that is most directly applicable to combinatorial optimization The questions that receive the most attention are those that deal with discrete optimization problems for points in Euclidean space such as the minimum spanning tree the traveling salesman tour and minimal length matchings Still there are several nongeometric optimization problems that receive full treatment and these include the problems of the longest common subsequence and the longest increasing subsequence The philosophy that guides the exposition is that analysis of concrete problems is the

most effective way to explain even the most general methods or abstract principles There are three fundamental probabilistic themes that are examined through our concrete investigations First there is a systematic exploitation of martingales The second theme that is explored is the systematic use of subadditivity of several flavors ranging from the naive subadditivity of real sequences to the subtler subadditivity of stochastic processes The third and deepest theme developed here concerns the application of Talagrand's isoperimetric theory of concentration inequalities

Mathematical Analysis of Viscoelastic Flows Michael Renardy, 2000-01-01 This monograph is based on a series of lectures presented at the 1999 NSF CBMS Regional Research Conference on Mathematical Analysis of Viscoelastic Flows It begins with an introduction to phenomena observed in viscoelastic flows the formulation of mathematical equations to model such flows and the behavior of various models in simple flows It also discusses the asymptotics of the high Weissenberg limit the analysis of flow instabilities the equations of viscoelastic flows jets and filaments and their breakup as well as several other topics

Random Number Generation and Quasi-Monte Carlo Methods Harald Niederreiter, 1992-01-01 This volume contains recent work in uniform pseudorandom number generation and quasi Monte Carlo methods and stresses the interplay between them

A Unified Approach to Boundary Value Problems Athanassios S. Fokas, 2008-11-06 A novel approach to analysing initial boundary value problems for integrable partial differential equations PDEs in two dimensions based on ideas of the inverse scattering transform that the author introduced in 1997 This method is unique in also yielding novel integral representations for linear PDEs Several new developments are addressed in the book including a new transform method for linear evolution equations on the half line and on the finite interval analytical inversion of certain integrals such as the attenuated Radon transform and the Dirichlet to Neumann map for a moving boundary integral representations for linear boundary value problems analytical and numerical methods for elliptic PDEs in a convex polygon and integrable nonlinear PDEs An epilogue provides a list of problems on which the author's new approach has been used offers open problems and gives a glimpse into how the method might be applied to problems in three dimensions

Mathematical Theories of Populations Frank. Hoppensteadt, 1975-01-01 Mathematical theories of populations have appeared both implicitly and explicitly in many important studies of populations human populations as well as populations of animals cells and viruses They provide a systematic way for studying a population's underlying structure A basic model in population age structure is studied and then applied extended and modified to several population phenomena such as stable age distributions self limiting effects and two sex populations Population genetics are studied with special attention to derivation and analysis of a model for a one locus two allele trait in a large randomly mating population The dynamics of contagious phenomena in a population are studied in the context of epidemic diseases

Conjugate Duality and Optimization R. Tyrrell Rockafellar, 1974-01-01 The theory of duality in problems of optimization is developed in a setting of finite and infinite dimensional spaces using convex analysis Applications to convex and nonconvex problems Expository account containing many new results Author

Theory and Applications of Viscous Fluid Flows Radyadour Kh. Zeytounian, 2013-06-29 This book is the natural sequel to the study of nonviscous fluid flows presented in our recent book entitled *Theory and Applications of Nonviscous Fluid Flows* and published in 2002 by the Physics Editorial Department of Springer Verlag ISBN 3 540 41412 6 Springer Verlag Berlin Heidelberg New York The physical concept of viscosity for so called real fluids is associated both incompressible and compressible fluids Consequently we have with a vast field of theoretical study and applications from which any subsection could have itself provided an area for a single book It was however decided to attempt a global study so that each chapter serves as an introduction to more specialized study and the book as a whole presents a necessary broad foundation for further study in depth Consequently this volume contains many more pages than my preceding book devoted to nonviscous fluid flows and a large number 80 of figures There are three main models for the study of viscous fluid flows First the model linked with viscous incompressible fluid flows the so called dynamic Navier model governing linearly viscous divergenceless and homogeneous fluid flows The second is the so called Navier Stokes model NS which is linked to compressible linearly viscous and isentropic equations for a polytropic viscous gas The third is the so called Navier Stokes Fourier model NSF that governs the motion of a compressible linearly viscous heat conducting gas
