**Technical Memorandum** ,1953 Chiefly translations from foreign aeronautical journals      **NASA Technical Note** ,1973      The Elastic Response of Bias-ply Aircraft Tires to Braking Forces John A. Tanner,John L. McCarty,Sidney A.

Batterson,1971 A study was made to evaluate the elastic behavior of a braked rolling tire and to relate this behavior to the tire characteristics obtained from simple static flexure tests The study consisted of static and braked rolling tests of two types of bias ply aircraft tires and an analysis which related tire reaction to the braking forces The results of this investigation indicate that the elastic response of an aircraft tire to braking forces can be defined by the displacement distribution along the tire periphery and by the fore and aft spring constant Changes in the rolling radius due to braking can be predicted with reasonable accuracy from elastic measurements of the static free tread periphery or from elastic measurements within the footprint during low speed braking assuming there is no slippage between the tire and the pavement The results of these tests further indicate that what was heretofore considered as pure tire slippage under braked rolling conditions may be wholly or in part the result of tire elasticity The elasticity must be considered in the design or application of efficient automatic braking systems      *Quasi-Static and Dynamic Response Characteristics of F-4 Bias-Ply and Radial-Belted Main Gear Tires* Pamela A. National Advisory Committee for Aeronautics,1957      **Pressure Rise Associated with Shock-induced Boundary-layer Separation** Eugene S. Love,1955 Some recent contributions to the problem of shock induced separation of the boundary layer are examined and additional analytical and experimental results are presented The probable ranges of pressure rises and flow deflections associated with separation are indicated Consideration is given to the effects of Mach number adverse pressure gradient and Reynolds number for laminar boundary layers and to the effects of Mach number Reynolds number and ratio of specific heats for turbulent boundary layers      **NASA Technical Report** ,1960      Index of NACA Technical Publications United States.

National Advisory Committee for Aeronautics,1953      Investigation of Some Mechanical Properties of Thermenol Compressor Blades Donald F. Johnson,1957 Comparison in bending and torsional deflection tests showed thermenol to have a modulus of elasticity of about 26 000 000 and a modulus of rigidity of about 9 000 000      *Mechanical Properties of Pneumatic Tires with Special Reference to Modern Aircraft Tires* Robert F. Smiley,Walter B. Horne,1958 A study is presented of pneumatic tires which are of interest to aircraft designers The principal topics discussed are tire vertical force deflection characteristics lateral fore and aft and torsional spring constants footprint area properties relaxation lengths rolling radius cornering force cornering power self aligning torque and pneumatic caster for yawed rolling conditions effects of wheel tilt

and tire radial growth under the influence of centrifugal forces      Technical Note United States. Hoene,1951 The equations of motion for an airplane penetrating a gust are derived using a few simplifying assumptions Calculations of loads for different static longitudinal stability on two German airplane models HC 45 and HS 122 are compared with flight tests Good agreement is obtained between the trend of the flight tests and the calculated values however no absolute comparison was possible between the flight tests and calculations
