Nanophysics Proceedings Of The Les Houches Summer School 2004:

Nanophysics: Coherence and Transport, 2005-08-02 The developments of nanofabrication in the past years have enabled the design of electronic systems that exhibit spectacular signatures of quantum coherence Nanofabricated quantum wires and dots containing a small number of electrons are ideal experimental playgrounds for probing electron electron interactions and their interplay with disorder Going down to even smaller scales molecules such as carbon nanotubes fullerenes or hydrogen molecules can now be inserted in nanocircuits Measurements of transport through a single chain of atoms have been performed as well Much progress has also been made in the design and fabrication of superconducting and hybrid nanostructures be they normal superconductor or ferromagnetic superconductor Quantum coherence is then no longer that of individual electronic states but rather that of a superconducting wavefunction of a macroscopic number of Cooper pairs condensed in the same quantum mechanical state Beyond the study of linear response regime the physics of non equilibrium transport including non linear transport rectification of a high frequency electric field as well as shot noise has received much attention with significant experimental and theoretical insights All these quantities exhibit very specific signatures of the quantum nature of transport which cannot be obtained from basic conductance measurements Basic concepts and analytical tools needed to understand this new physics are presented in a series of theoretical fundamental courses in parallel with more phenomenological ones where physics is discussed in a less formal way and illustrated by many experiments Electron electron interactions in one dimensional quantum transport Coulomb Blockade and Kondo physics in quantum dots Out of equilibrium noise and quantum transport Andreev reflection and subgap nonlinear transport in hybrid N S nanostructures Transport through atomic contacts Solid state Q bits Written by leading experts in the field both theorists and experimentalists

Quantum Machines: Measurement and Control of Engineered Quantum Systems Michel Devoret, Benjamin Huard, Robert Schoelkopf, Leticia F. Cugliandolo, 2014-06-12 This book gathers the lecture notes of courses given at the 2011 summer school in theoretical physics in Les Houches France Session XCVI What is a quantum machine Can we say that lasers and transistors are quantum machines After all physicists advertise these devices as the two main spin offs of the understanding of quantum mechanical phenomena However while quantum mechanics must be used to predict the wavelength of a laser and the operation voltage of a transistor it does not intervene at the level of the signals processed by these systems Signals involve macroscopic collective variables like voltages and currents in a circuit or the amplitude of the oscillating electric field in an electromagnetic cavity resonator In a true quantum machine the signal collective variables which both inform the outside on the state of the machine and receive controlling instructions must themselves be treated as quantum operators just as the position of the electron in a hydrogen atom Quantum superconducting circuits quantum dots and quantum nanomechanical resonators satisfy the definition of quantum machines These mesoscopic systems exhibit a few collective dynamical variables whose fluctuations are well in the quantum regime and whose measurement is essentially

limited in precision by the Heisenberg uncertainty principle Other engineered quantum systems based on natural rather than artificial degrees of freedom can also qualify as quantum machines trapped ions single Rydberg atoms in superconducting cavities and lattices of ultracold atoms This book provides the basic knowledge needed to understand and investigate the physics of these novel systems *The British National Bibliography* Arthur James Wells, 2006 **Active Matter and**

Nonequilibrium Statistical Physics Julien Tailleur, Gerhard Gompper, M. Cristina Marchetti, Julia M. Yeomans, Christophe Salomon, 2022 The topic of the CXII session of the Les Houches Summer School held in September 2018 was Active Matter and Nonequilibrium Statistical Physics offering a broad introduction to the foundations and modern applications of active matter and nonequilibrium physics *Strongly Interacting Quantum Systems out of Equilibrium* Thierry Giamarchi, Andrew J. Millis, Olivier Parcollet, Hubert Saleur, Leticia F. Cugliandolo, 2016-11-17 Over the last decade new experimental tools and theoretical concepts are providing new insights into collective nonequilibrium behavior of quantum systems The exquisite control provided by laser trapping and cooling techniques allows us to observe the behavior of condensed bose and degenerate Fermi gases under nonequilibrium drive or after quenches in which a Hamiltonian parameter is suddenly or slowly changed On the solid state front high intensity short time pulses and fast femtosecond probes allow solids to be put into highly excited states and probed before relaxation and dissipation occur Experimental developments are matched by progress in theoretical techniques ranging from exact solutions of strongly interacting nonequilibrium models to new approaches to nonequilibrium numerics The summer school Strongly interacting quantum systems out of equilibrium held at the Les Houches School of Physics as its XCIX session was designed to summarize this progress lay out the open questions and define directions for future work This books collects the lecture notes of the main courses given in this summer school
