A. Bononi, 2012-12-06 The new information services provided worldwide through the Internet are fostering the upgrade of existing access and transmission plants and the deployment of new ones The bandwidth bottlenecks of existing electronic plants are being gradually removed by the massive use of optics at all levels The latest technological developments in optical system components have finally made the huge bandwidth of optical fibers available both for increasing the amount of transmitted information and for reducing the transmission cost per information bit Wavelength Division Multiplexing WDM is now a commercial reality widely employed in the upgrade of existing point to point optical communications links and in most upcoming newly installed fiber links High speed Optical Time Division Multiplexing OTDM offers a complementary approach to WDM to tap even more into the fiber bandwidth OTDM is however still in competition with Electronic TDM ETDM and as technology in integrated electronics progresses along with the optical technology the boundary where OTDM becomes more convenient than ETDM is still blurred and is a time dependent variable While the main design guidelines for point to point optical links are now well established much research work remains to be done in the area of optical networking where the resources of many interconnected point to point optical links are time shared Work is to be done in the transmission field as well as in the protocol control and management field The feasibility of integrating all-optical-network technology in

Technology L.S. Grattan, B.T. Meggitt, 2013-03-09 Environmental and chemical sensors in optical fiber sensor technology The nature of the environment in which we live and work and the precarious state of many aspects of the natural environment has been a major lesson for scientists over the last few decades Public awareness of the issues involved is high and often coupled with a scepticism of the ability of the scientist and engineer to provide an adequate or even rapid solution to the preservation of the environment before further damage is done and to achieve this with a minimum of expenditure Monitoring of the various aspects of the environment whether it be external or internal to ourselves and involving chemical physical or biomedical parameters is an essential process for the well being of mankind and of the individual Legislative requirements set new standards for measurement and control all around us which must be met by the most appropriate of the technologies available commensurate with the costs involved Optical fiber sensor technology has a major part to play in

this process both to complement existing technologies and to promote new solutions to difficult measurement issues. The developments in new sources and detectors covering wider ranges of the electromagnetic spectrum with higher sensitivity allow the use of techniques that some time ago would have been considered inappropriate or lacking in sufficient sensitivity.
