Mathematics For The Social Behavioral:

Mathematics Motivated by the Social and Behavioral Sciences Donald G. Saari, 2018-02-06 The mathematical challenges coming from the social and behavioral sciences differ significantly from typical applied mathematical concerns Change for instance is ubiquitous but without knowing the fundamental driving force standard differential and iterative methods are not appropriate Although differing forms of aggregation are widely used a general mathematical assessment of potential pitfalls is missing These realities provide opportunities to create new mathematical approaches These themes are described in an introductory expository and accessible manner by exploring new ways to handle dynamics and evolutionary game theory to identify subtleties of decision and voting methods to recognize unexpected modeling concerns and to introduce new approaches with which to examine game theory Applications range from avoiding undesired consequences when designing policy to identifying unanticipated voting where the wrong person could win nonparametric statistical and economic supply and demand properties

Qualitative Mathematics for the Social Sciences Lee Rudolph, 2013-01-03 In this book Lee Rudolph brings together international contributors who combine psychological and mathematical perspectives to analyse how qualitative mathematics can be used to create models of social and psychological processes Bridging the gap between the fields with an imaginative and stimulating collection of contributed chapters the volume updates the current research on the subject which until now has been rather limited focussing largely on the use of statistics Qualitative Mathematics for the Social Sciences contains a variety of useful illustrative figures introducing readers from the social sciences to the rich contribution that modern mathematics has made to our knowledge of logic structures and dynamic systems A beguiling array of conceptual systems topological models and fractals are discussed which transcend the application of statistics and bring a fresh perspective to the study of social representations The wide selection of qualitative mathematical methodologies discussed in this volume will be hugely valuable to higher level undergraduate and postgraduate students of psychology sociology and mathematics It will also be useful for researchers academics and professionals from the social sciences who want a firmer grasp on the use of qualitative mathematics

Fararo,Kenji Kosaka,2013-03-09 Generating Images of Stratification is a self contained presentation of a theoretical research program that deals with a significant explanatory problem relating to social inequality and that constructs generative theoretical models in doing so In more detail Self contained presentation In respect to the background sociological facts and theoretical ideas and also the formal methods the book provides clear and simple accounts accompanied by examples A theoretical research program The emphasis is on theory development involving a series of theoretical models constructed within a core framework of principles and methods Deals with a significant explanatory problem relating to social inequality We know from research that how people perceive the stratification system of a society depends upon their position in that system So the problem is What process generates this regularity and thereby explains empirical generalizations about the social structuration of images Constructs generative theoretical models The book is an extended presentation of generative theory in sociology a formal method of producing effective theoretical explanations Generating Images of Stratification is of interest to mathematical sociologists and formal theorists in sociology sociologists interested in social stratification methodologists both in sociology and in other fields philosophers of social science and theoretical scientists and mathematicians who are interested in applying their analytical tools to social science topics **Mathematical Models in**

Porter,Alexandria Volkening,2025-04-17 The spread of memes and misinformation on social media political redistricting gentrification in urban communities pedestrian movement in crowds and the dynamics of voters are among the many social phenomena that researchers investigate in the field of complex systems In the study of complex social systems there is often also societal relevance to improving our understanding of how individuals interact with each other and their environment giving rise to collective group dynamics The mathematical and computational study of complex social systems relies on and motivates the development of methods in many topics

including mathematical modeling data analysis network science and topology and geometry This volume is a collection of diverse articles about complex social systems This collection includes both 1 survey and tutorial articles that introduce complex social systems and methods to study them and 2 manuscripts with original research that highlight a variety of mathematical areas and applications This book introduces the study of complex social systems to a broad mathematical audience It will particularly appeal to people who are interested in applied mathematics

Mathematical Analyses of Decisions, Voting and Games Michael A. Jones, David McCune, Jennifer M. Wilson, 2024-03-25 This volume contains the proceedings of the virtual AMS Special Session on Mathematics of Decisions Elections and Games held on April 8 2022 Decision theory voting theory and game theory are three related areas of mathematics that involve making optimal decisions in different contexts While these three areas are distinct much of the recent research in these fields borrows techniques from other branches of mathematics such as algebra combinatorics convex geometry logic representation theory etc The papers in this volume demonstrate how the mathematics of decisions elections and games can be used to analyze problems from the social sciences

The American Faculty Jack H. Schuster, Martin J. Finkelstein, 2008-12-15 Higher education is becoming destabilized in the face of extraordinarily rapid change The composition of the academy s most valuable asset the faculty and the essential nature of faculty work are being transformed Jack H Schuster and Martin J Finkelstein describe the transformation of the American faculty in the most extensive and ambitious analysis of the American academic profession undertaken in a generation A century ago the American research university emerged as a new organizational form animated by the professionalized discipline based scholar The research university model persisted through two world wars and greatly varying economic conditions In recent years however a new order has surfaced organized around a globalized knowledge based economy powerful privatization and market forces and stunning new information technologies These developments have transformed the higher education enterprise in ways barely imaginable in generations past At the heart of that transformation but largely invisible has been a restructuring of academic appointments academic work and academic careers a reconfiguring widely decried but heretofore

inadequately described This volume depicts the scope and depth of the transformation combining empirical data drawn from three decades of national higher education surveys The authors portrait at once startling and disturbing provides the context for interpreting these developments as part of a larger structural evolution of the national higher education system They outline the stakes for the nation and the challenging work to be done [A Quest Towards a Mathematical Theory of Living Systems](#) Nicola Bellomo, Abdelghani Bellouquid, Livio Gibelli, Nisrine Outada, 2017-07-13 This monograph aims to lay the groundwork for the design of a unified mathematical approach to the modeling and analysis of large complex systems composed of interacting living things Drawing on twenty years of research in various scientific fields it explores how mathematical kinetic theory and evolutionary game theory can be used to understand the complex interplay between mathematical sciences and the dynamics of living systems The authors hope this will contribute to the development of new tools and strategies if not a new mathematical theory The first chapter discusses the main features of living systems and outlines a strategy for their modeling The following chapters then explore some of the methods needed to potentially achieve this in practice Chapter Two provides a brief introduction to the mathematical kinetic theory of classical particles with special emphasis on the Boltzmann equation the Enskog equation mean field models and Monte Carlo methods are also briefly covered Chapter Three uses concepts from evolutionary game theory to derive mathematical structures that are able to capture the complexity features of interactions within living systems The book then shifts to exploring the relevant applications of these methods that can potentially be used to derive specific usable models The modeling of social systems in various contexts is the subject of Chapter Five and an overview of modeling crowd dynamics is given in Chapter Six demonstrating how this approach can be used to model the dynamics of multicellular systems The final chapter considers some additional applications before presenting an overview of open problems The authors then offer their own speculations on the conceptual paths that may lead to a mathematical theory of living systems hoping to motivate future research activity in the field A truly unique contribution to the existing literature A Quest Toward a Mathematical Theory of Living Systems is an important book that will no doubt have a significant influence on the future directions of the field It will be of interest to mathematical biologists systems biologists biophysicists and other researchers working on understanding the complexities of living systems

Mathematical and Statistics Anxiety: Educational, Social, Developmental and Cognitive Perspectives Kinga Morsanyi, Irene Cristina Mammarella, Denes Szűcs, Carlo Tomasetto, Caterina Primi, Erin Anne Maloney, 2017-01-19 Mathematical anxiety is a feeling of tension apprehension or fear which arises when a person is faced with mathematical content The negative consequences of mathematical anxiety are well documented Students with high levels of mathematical anxiety might underperform in important test situations they tend to hold negative attitudes towards mathematics and they are likely to opt out of elective mathematics courses which also affects their career opportunities Although at the university level many students do not continue to study mathematics social science students are confronted

with the fact that their disciplines involve learning about statistics another potential source of anxiety for students who are uncomfortable with dealing with numerical content Research on mathematical anxiety is a truly interdisciplinary field with contributions from educational developmental cognitive social and neuroscience researchers The current collection of papers demonstrates the diversity of the field offering both new empirical contributions and reviews of existing studies The contributors also outline future directions for this line of research
