Sedimentation Der Variszischen Molasse:

Sedimentation der variszischen Molasse im Thüringer Wald Harald Lützner, 1981-12-31 Keine ausführliche Beschreibung für Sedimentation der variszischen Molasse im Thüringer Wald verfügbar Aspects of Fluvial Sedimentation in the Lower Triassic Buntsandstein of Europe Detlef Mader, 2006-04-10 The Permian of Northern Pangaea Peter A. Scholle, Tadeusz M. Peryt, Dana S. Ulmer-Scholle, 2012-12-06 The Permian was a remarkable time period. It represents the maximum stage of Pangean continental assembly, includes a major global climatic shift from glacial to nonglacial conditions, icehouse greenhouse transition, and is terminated by one of the most profound faunal/floral extinction events in the Earth's history. In addition, Permian oceans, although poorly understood, must have had some quite unique characteristics. Permian seas reached the most extreme values of carbon/sulfur and strontium isotopic ratios ever achieved in Phanerozoic time, and the isotopic ratios of all three elements abruptly returned to more normal values at or very close to the Permian-Triassic boundary. Finally, the Permian is marked by an abundance of important sedimentary mineral resources. It has large fossil fuel concentrations: coal, oil, and natural gas; enormous phosphate reserves; and very extensive evaporite deposits, including gypsum, anhydrite, and halite, as well as a variety of potash salts. Study of the Permian has been hampered, however, by a number of factors. These include a scattered geologic literature presented in a variety of languages; a confusing regional and global stratigraphic framework based in part on inadequate type sections and largely provincial, often poorly correlatable faunas. All have contributed to the sparsity and inadequacy of overviews of this critical geological interval. These two volumes attempt to bring together some of the widely scattered observations about these fascinating rocks, at least for the northern, predominantly nonglacial parts of Pangaea. Hydraulic Proppant Fracturing and Gravel Packing D. Mader, 1989-03-01 Many aspects of hydraulic proppant fracturing have changed since its innovation in 1947. The main significance of this book is its combination of technical and economical aspects to provide an integrated overview of the various applications of proppants in hydraulic fracturing and gravel in sand control. The monitoring of fractures and gravel packs by well logging and seismic techniques is also included. The book's extensive coverage of the subject should be of special interest to reservoir geologists and engineers, production engineers, and technologists, and well log analysts. Friedrich, Peter M. Herzig, 2013-03-09 The geology and metallogeny of base metal sulfide deposits in Europe, Africa, and Australia was the topic of the DMG/GDMB/SAG Joint Meeting held in Aachen, FRG, September 16-19, 1985. Divided into two parts, the presented papers cover the description and interpretation of sediment-hosted as well as volcanic sediment-hosted and volcanic-hosted copper-zinc-lead-gold-silver deposits. The present compilation is an overview of current research activities and results on copper-zinc-lead deposits in classical mining districts, considering geological, lithological, geochemical,

and tectonic parameters of ore formation Even in periods of depressed metal prices base metal sulfide deposits still remain one of the most attractive mineral exploration targets This extensive review provides valuable information to researchers and explorationists

The Alps are an arched mountain chain stretching 1500 km between Vienna and Graz in Austria and Genova in Italy They resulted from the collision of the African and Laurasian plates during Mesozoic and Tertiary times The high standard of knowledge attained over the last 30 years by the working groups on Alpine Metamorphism is well known and helped considerably to recognize pre Mesozoic elements in the Alps In Part I of this book the subdivision of the major Alpine units and pre Mesozoic pal inspastic reconstructions are covered before discussion of the pre Mesozoic geology in Parts II III and IV It is understood that the Mesozoic and later events overprinted pre existing structures veiling the earlier history and the nature of protoliths Although the Alpine overprint does not facilitate the recognition of older structures pre Mesozoic basement units were recognized during the first beginnings of geological observations in the Alps about 200 years ago Fifty percent of the Alpine domain is underlain by basement units that have been unconformably covered since Permian and Mesozoic times This basement appears today in a complex pattern among the Alpine structures The history of their discovery and explanation parallel with a growing sophistication of research methods are the subject of the introductory chapter of Part II
