Seismic Hazard Mitigation in Balkan Countries Eystein S. Husebye, 2008-03-01 Seismology is rated the Queen of Earth Sciences due to its ability to provide detailed structural information bearing on the Earth interior and on going dynamic processes This is due to the advanced theoretical foundation of seismology and the extensive cooperation among seismologists on recording and disseminating of data worldwide In contrast some 40 years ago seismology was a backward science and hence funding was poor This abruptly changed with the political interest in seismology as the principal tool for monitoring compliance with a potential Comprehensive Nuclear Test Ban treaty CTBT banning nuclear testing in any environment Major countries like USA UK and USSR launched large scale research programs including deployment of modern seismograph stations and arrays and these developments are detailed in the book for CTBTO UN IRIS USA MedNet Italy Geofon Germany and the tiny Karelia network NW Russia Station and network operations require near real time record analysis and topics dealt with here are 2 D signal detector epicenter location and earthquake monitoring Balkan is seismically the most active part of Europe due to multiple plate interactions in the Aegean Sea The tectonic evolution and on going geodynamic deformations are described in 2 articles Earthquake hazard analysis and topographic site effects are discussed and likewise large earthquake hazards in the Aegean and the Marmara seas relate to practical applications of such procedures Foremost the book gives a good account of past present and likely future seismological developments in Balkan countries and various kinds of network operations on local to global scales

Earthquakes in the Mediterranean and Middle East Nicholas Ambraseys, 2009-10-22 This book examines historical evidence from the last 2000 years to analyse earthquakes in the eastern Mediterranean and Middle East Early chapters review techniques of historical seismology while the main body of the book comprises a catalogue of more than 4000 earthquakes identified from historical sources Each event is supported by textual evidence extracted from primary sources and translated into English Covering southern Rumania Greece Turkey Lebanon Israel Egypt Jordan Syria and Iraq the book documents past seismic events places them in a broad tectonic framework and provides essential information for those attempting to prepare for and mitigate the effects of future earthquakes and tsunamis in these countries This volume is an indispensable reference for researchers studying the seismic history of the eastern Mediterranean and Middle East including archaeologists historians earth scientists engineers and earthquake hazard analysts A parametric catalogue of these seismic events can be downloaded from www.cambridge.org/9780521872928

Characterization of Modern and Historical Seismic-Tsunami Events, and Their Global-Societal Impacts Y. Dilek, Y. Ogawa, Y. Okubo, 2021-06-22 Earthquakes and tsunamis are devastating geohazards with significant societal impacts Most recent occurrences have shown that their impact on the stability of nations societies and the world geopolitics is immense potentially triggering a tipping point for a major downturn in the global economy This Special Publication presents the most current information on the causes and effects of some of the modern and historical earthquake tsunami events and effective practices of risk assessment disaster management implemented by various

governments international organizations and intergovernmental agencies Findings reported here show that the magnitude of human casualties and property loss resulting from earthquakes tsunamis are highly variable around the globe and that increased community national and global resilience is significant to empower societal preparedness for such geohazards It is clear that all stakeholders including scientists policymakers governments media and world organizations must work together to disseminate accurate objective and timely information on geohazards and to develop effective legislation for risk reduction and realistic hazard mitigation management measures in our globally connected world of today

Integration of Earth Science Research on the Turkish and Greek 1999 Earthquakes Naci Görür, Gerassimos A. Papadopoulos, Nilgün Okay, 2012-12-06 In 1999 two earthquakes occurred in the Istanbul Marmara region of Turkey and the Athens Corinth region of Greece and an increased risk of further events caused great concern among the earth science community This book presents and discusses the latest results from studies of the Izmit D zce and Athens earthquakes and assesses the data that are available and relevant to the geology seismology tectonics geodesy and other fields related to earthquake studies and to evaluate earthquake hazard potential

Michetti, Pablo Gabriel Silva, 2009 Given the tremendous toll in human lives and attendant economic losses it is appropriate that scientists are working hard to understand better earthquakes with the aim of forecasting and ultimately predicting them In the last decades increasing attention has been

paid to the coseismic effects on the natural environment creating a solid base of empirical data for the estimation of source parameters of strong earthquakes based on geological observations The recently introduced INQUA scale Environmental Seismic Intensity ESI 2007 Scale of macroseismic intensity clearly shows how the systematic study of earthquake surface faulting coseismic liquefaction tsunami deposits and other primary and secondary ground effects can be integrated with traditional seismological and tectonic information to provide a better understanding of the seismicity level of an area and the associated hazards At the moment this is the only scientific means of equating the seismic records to the seismic cycle time spans extending the seismic catalogues even to tens of thousands of years improving future seismic hazard analyses This Special Publication covers some of the latest multidisciplinary work undertaken to achieve that aim Eighteen papers from research groups from all continents address a wide range of topics related both to palaeoseismological studies and assessment of macroseismic intensity based only on the natural phenomena associated with an earthquake Tectonic and Structural Framework of the Zagros Fold-Thrust Belt Ali Farzipour Saein, 2018-12-07 The latest volume in the Developments in Structural Geology and Tectonics series from Elsevier Tectonic and Structural Framework of the Zagros Fold Thrust Belt is a collection of the most up to date research and developments in the unique tectonic and structural geology of the Zagros The Zagros fold thrust belt is famous among geologists and is one of the most studied terrains in the world Because of its unique structures the Zagros orogeny is challenging for many researchers and experts this book is the essential reference that collates the newest data and fully explores that aspect In addition because the Zagros range is a potential source for hydrocarbons it is of interest to petroleum geologists and exploration companies worldwide This book is an essential cutting edge reference for oil companies structural geologists and students at both the undergraduate and postgraduate levels Includes valuable new data about one of the most famous collisional mountain ranges in the world the Zagros fold thrust belts as a guide for other collisional ranges such as the Himalaya the Alps and the Andes as they share common fundamental deformation mechanisms Provides research from geologists across the world with the goal of understanding the unique dynamics and kinematics of the Zagros range
