Common neurologic emergencies for nonneurologists: When minutes count

ABSTRACT

Neurologic emergencies arise frequently and, if not diagnosed and treated quickly, can have devastating results, with high rates of long-term disability and death. Prompt recognition is an important skill. This article provides detailed analyses of acute stroke, subarachnoid hemorrhage, status epilepticus, and other neurologic emergencies for physicians who are not neurologists.

KEY POINTS

Patients with possible acute ischemic stroke should be assessed quickly to see if they should receive tissue plasminogen activator, which should be started within 3 hours of stroke onset. Computed tomography (CT) of the head without contrast should be done immediately to rule out acute hemorrhagic stroke.

Acute treatment of intracerebral hemorrhage includes blood pressure control, reversal of underlying coagulopathy, and sometimes intracranial pressure control.

If the clinical suspicion of subarachnoid hemorrhage remains strong even though initial CT was negative, lumbar puncture is mandatory.

Hyperosmolar therapy is the mainstay of emergency medical treatment of intracranial hypertension.

Seizure activity must be treated aggressively to prevent recalcitrant seizure activity, neuronal damage, and progression to status epilepticus.

NEUROLOGIC EMERGENCIES such as acute stroke, status epilepticus, subarachnoid hemorrhage, neuromuscular weakness, and spinal cord injury affect millions of Americans yearly.^{1,2} These conditions can be difficult to diagnose, and delays in recognition and treatment can have devastating results. Consequently, it is important for nonneurologists to be able to quickly recognize these conditions and initiate timely management, often while awaiting neurologic consultation.

Here, we review how to recognize and treat these common, serious conditions.

■ ACUTE ISCHEMIC STROKE: TIME IS OF THE ESSENCE

Stroke is the fourth leading cause of death in the United States and is one of the most common causes of disability worldwide.¹⁻³ About 85% of strokes are ischemic, resulting from diminished vascular supply to the brain. Symptoms such as facial droop, unilateral weakness or numbness, aphasia, gait deviation, and unsteadiness of gait may be seen. Time is of the essence, as all currently available interventions are safe and effective only within defined time windows.

Diagnosis and assessment

When acute ischemic stroke is suspected, the clinical history, time of onset, and basic neurologic examination should be obtained quickly.

The National Institutes of Health (NIH) stroke scale is an objective marker for assessing stroke severity as well as evolution of disease and should be obtained in all stroke patients. Scores range from 0 (best) to 42 (worst) (www.ninds.nih.gov/doctors/NIH_Stroke_Scale.pdf).
