*Routing, Flow And Capacity Design In Communication And Computer Networks* Michal Pioro, 2005-01-01      **Routing, Flow, and Capacity Design in Communication and Computer Networks** Michal Pioro, Deep Medhi, 2004-07-21

In network design the gap between theory and practice is woefully broad. This book narrows it comprehensively and critically examining current network design models and methods. You will learn where mathematical modeling and algorithmic optimization have been underutilized. At the opposite extreme you will learn where they tend to fail to contribute to the twin goals of network efficiency and cost savings. Most of all you will learn precisely how to tailor theoretical models to make them as useful as possible in practice. Throughout the authors focus on the traffic demands encountered in the real world of network design. Their generic approach however allows problem formulations and solutions to be applied across the board to virtually any type of backbone communication or computer network. For beginners this book is an excellent introduction. For seasoned professionals it provides immediate solutions and a strong foundation for further advances in the use of mathematical modeling for network design. Written by leading researchers with a combined 40 years of industrial and academic network design experience. Considers the development of design models for different technologies including TCP/IP, IDN, MPLS, ATM, SONET, SDH and WDM. Discusses recent topics such as shortest path routing and fair bandwidth assignment in IP/MPLS networks. Addresses proper multi-layer modeling across network layers using different technologies for example IP over ATM over SONET, IP over WDM and IDN over SONET. Covers restoration oriented design methods that allow recovery from failures of large capacity transport links and transit nodes. Presents at the end of each chapter exercises useful to both students and practitioners.

**Multiple Criteria Decision Analysis** Salvatore Greco, Matthias Ehrgott, José Rui Figueira, 2016-02-18

Information processing in sensor networks is a rapidly emerging area of computer science and electrical engineering research. Because of advances in micro sensors, wireless networking and embedded processing, ad hoc networks of sensors are becoming increasingly available for commercial, military and homeland security applications. Examples include monitoring e.g. traffic, habitat security, industrial sensing and diagnostics e.g. factory appliances, infrastructures i.e. power grid, water distribution, waste disposal and battle awareness e.g. multi target tracking. This book introduces practitioners to the fundamental issues and technology constraints concerning various aspects of sensor networks such as information organization, querying, routing and self organization, using concrete examples and does so by using concrete examples from current research and implementation efforts. Written for practitioners, researchers and students and relevant to all application areas including environmental monitoring, industrial sensing and diagnostics, automotive and transportation security and surveillance, military and battlefield uses and large scale infrastructural maintenance. Skillfully integrates the many disciplines at work in wireless sensor network design: signal processing and estimation, communication theory and protocols, distributed algorithms and databases, probabilistic reasoning, energy aware computing, design methodologies, evaluation metrics and more. Demonstrates how querying, data routing and network self organization can support high level information processing tasks      **Network Recovery** Jean-Philippe Vasseur, Mario Pickavet, Piet Demeester, 2004-08-19
