Morphogenesis in Plant Tissue Cultures Woong-Young Soh, Sant Saran Bhojwani, 2013-11-11 Morphogenesis or developmental morphology is a dynamic process and a fascinating field of investigation Since the beginning of this century plant morphologists Eames 1961 anatomists Eames and Macdaniels 1947 and embryologists Maheshwari 1950 have studied the processes of development and differentiation by observing whole plants and their histological preparations and have generated a wealth of information on the structural changes associated with various developmental stages in the life cycle of a large number of plant species Around 1940 plant morphogenesis became an experimental field when plant physiologists initiated studies on the effect of treatments such as application of physiologically active compounds or growth regulators irradiation exposure to different day length temperature and injury on morphological and structural changes During the past two decades geneticists and molecular biologists have become interested in plant morphogenesis and extensive work is being done to understand the regulation of gene expression during morphogenesis and how the products of genetic information control the developmental processes

Plant Biotechnology and Agriculture Ivana Machácková, Georgy A. Romanov, 2013-11-11 Phytohormone research is a crucially important area of plant sciences. Phytohormones are one of the key systems integrating metabolic and developmental events in the whole plant and the response of plants to external factors. Thus they influence the yield and quality of crops. During the last decade we have slowly begun to understand the molecular mechanisms underlying phytohormone action, largely as a result of the rapid developments that have been made internationally in the field of plant molecular genetics. Putative receptor proteins for ethylene (1993-95), brassinosteroids (1997) and cytokinins (2001) have been identified, and the genes that encode them cloned. Primary response genes and elements of hormonal signal transduction have also been identified for most known phytohormones. There is now little doubt that phytohormones, like their animal counterparts, function as signal molecules and create a signalling network in the whole plant organism. The *in vivo* activity of hormones depends, among other things, on their rate of biosynthesis and metabolism and on their transport into and out of target cells. Consequently, genes and enzymes involved in these processes are of particular interest. In recent years, a number of genes encoding enzymes for the synthesis, modification and degradation of different phytohormones have been cloned and identified, as have genes encoding proteins involved in phytohormone transport and its regulation. Some classes of phytohormone have been shown to participate in stress reactions and can increase the resistance of plants to unfavorable environmental factors.
