Enns, 1990-08-23 This volume presents an up to date review of developmental aspects of human attention by leading researchers and theorists The papers included in the first section consider the ways in which newborns are pretuned to visual auditory linguistic and social features of their environment as well as how selectivity to these features changes in the first year of life The following section examines properties of the visual and auditory world that are attention getting for children Developmental increases in capacity and strategy are also examined in this section through the study of perception memory problem solving and language Section III explores several ways in which selective processing can fail in development e g autism hyperactivity and psychopathy while Section IV reports on those aspects of selectivity that are lost and preserved in the aging process **The Oxford Handbook of Event-Related Potential Components** Steven J. Luck, Emily S. Kappenman, 2013-07-04 The Oxford Handbook of Event Related Potential Components provides a detailed and comprehensive overview of the major ERP components The Brain's Representational Power Cyriel M.A. Pennartz, 2015-10-02 A neuroscientifically informed theory arguing that the core of qualitative conscious experience arises from the integration of sensory and cognitive modalities Although science has made considerable progress in discovering the neural basis of cognitive processes how consciousness arises remains elusive In this book Cyriel Pennartz analyzes which aspects of conscious experience can be peeled away to access its core the hardest aspect the relationship between brain processes and the subjective qualitative nature of consciousness Pennartz traces the problem back to its historical roots in the foundations of neuroscience and connects early ideas on sensory processing to contemporary computational neuroscience What can we learn from neural network models and where do they fall short in bridging the gap between neural processes and conscious experience Do neural models of cognition resemble inanimate systems and how can this help us define requirements for conscious processing in the brain These questions underlie Pennartz's examination of the brain's anatomy and neurophysiology The perspective of his account is not limited to visual perception but broadened to include other sensory modalities and their integration Formulating a representational theory of the neural basis of consciousness Pennartz outlines properties that complex structures must express to process information consciously This theoretical framework is constructed using empirical findings from neuropsychology and neuroscience as well as such theoretical arguments as the Chinese Room and the Wall Street Banker Positing that qualitative experience is a multimodal and multilevel phenomenon at its very roots Pennartz places this body of theory in the wider context of mind brain philosophy examining implications for our thinking about animal and robot consciousness **Proceedings of the**

Cognition across the psychiatric disorder spectrum: From mental health to clinical diagnosis Caroline Gurvich, Susan L. Rossell, 2015-08-31 Psychiatric symptoms are considered to be distributed along a continuum from good mental health to a diagnosable psychiatric disorder In the case of psychosis subclinical psychotic experiences which can include odd behaviors strange speech unusual perceptual experiences and social emotional withdrawal are often referred to as schizotypy Research examining schizotypal traits in non clinical populations is rapidly expanding The exploration of schizotypy allows us to identify areas of overlap with psychiatric disorders schizophrenia and related disorders at genetic biological environmental and psychosocial levels thus identifying putative risk factors as well as exploring potentially protective factors Schizotypy is also a valuable model for exploring cognition as performance is not confounded by issues often present in schizophrenia samples such as long term antipsychotic medication usage social isolation and recurrent hospitalizations Investigating cognition is a particularly important area of research as cognitive symptoms in schizophrenia such as impaired attention reduced memory and difficulties with executive functions are a core feature of schizophrenia and strongly related to quality of life and functional outcomes yet generally respond poorly to current treatment options The aim of this special Research Topic is to explore the relationship between cognition schizotypy and the schizophrenia spectrum The articles in this e book draw on a variety of perspectives and represent an interesting array of opinions reviews and empirical studies that begin to answer questions about the similarities and overlaps between schizotypy and schizophrenia spectrum disorders contributing to our understanding of potential risk factors Equally important is research that highlights differences between schizotypy and schizophrenia spectrum disorders that may enhance our understanding of potentially protective or adaptive features of schizotypy Collectively these articles highlight the exploratory potential of the study of schizotypy particularly in relation to better understanding cognition across the schizophrenia spectrum

What makes written words so special to the brain? Gui Xue, Urs Maurer, Mohamed L Seghier, 2015-01-22 Reading is an integral part of life in today's information driven societies Since the pioneering work of Dejerine on word blindness in brain lesioned patients the literature has increased exponentially from neuropsychological case reports to mechanistic accounts of word processing at the behavioural neurofunctional and computational levels tapping into diverse aspects of visual word processing These studies have revealed some exciting findings about visual word processing including how the brain learns to read how changes in literacy impact upon word processing strategies and whether word processing mechanisms vary across different alphabetic logographic or artificial writing systems Other studies have attempted to characterise typical and atypical word processes in special populations in order to explain why dyslexic brains struggle with words how multilingualism changes the way our brains see words and what the exact developmental signatures are that would shape the acquisition of reading skills Exciting new insights have also emerged from recent studies that have investigated word stimuli at the system network level by looking for instance at how the reading system interacts with other cognitive systems in a context dependent fashion how visual language stimuli are integrated into the speech processing streams how both left and right hemispheres cooperate and interact during word processing and what the exact contributions of subcortical and cerebellar regions to reading are The contributions to this Research Topic highlight the latest findings regarding the different issues mentioned above particularly how these findings can explain or model the different processes mechanisms pathways or cognitive strategies by which the human brain sees words The introductory editorial summarising the contributions included here highlights how varieties of behavioural tests and neuroimaging techniques can be used to investigate word processing mechanisms across different alphabetic and logographic writing systems

Bilingualism and Cognitive Control Ramesh Kumar Mishra, 2018-07-20 This thought provoking monograph makes a multidisciplinary case for bilingualism as a possible enhancer of executive function particularly cognitive control Its central focus is the cognitive operations of the bilingual brain in processing two languages and whether they afford the brain a greater edge on neuroplasticity in short a cognitive advantage Major issues and controversies in the debate are analyzed from cognitive neuroscience psycholinguistic and integrative perspectives with attention paid to commonly and rarely studied domains at work in bilingual processing The author also pinpoints future areas for improved research such as recognizing the diversity of bilingualism not simply in languages spoken but also in social context as seen among immigrants and refugees Included in the coverage The evolution of bilingualism What goes on in a bilingual mind The core cognitive mechanisms Cognitive advantage of bilingualism and its criticisms Neuroscience of bilingualism Bilingualism context and control Attention vision and control in bilinguals With its cogent takes on ongoing questions and emerging issues Bilingualism and Cognitive Control is of immediate interest to bilingual researchers and practitioners interested in understanding the behavioral aspects and neurobiology of bilingualism and the dynamic character of the bilingual multilingual second language learner's mind as well as the growing number of advanced undergraduate and graduate students interested in the psychology psycholinguistics of bilingualism bilingual cognitive psychology cognitive science and cognitive neuroscience

50 years after the perceptron, 25 years after PDP: Neural computation in language sciences Julien Mayor, Pablo Gomez, Franklin Chang, Gary Lupyan, 2014-08-11 This Research Topic aims to showcase the state of the art in language research while celebrating the 25th anniversary of the tremendously influential work of the PDP group and the 50th anniversary of the perceptron Although PDP models are often the gold standard to which new models are compared the scope of this Research Topic is not constrained to connectionist models Instead we aimed to create a landmark forum in which experts in the field define the state of the art and future directions of the psychological processes underlying language learning and use broadly defined We thus called for papers involving computational modeling and original research as well as technical philosophical or historical discussions pertaining to models of cognition We especially encouraged submissions aimed at contrasting different computational frameworks and their relationship to imaging and behavioral data

Connectionist Models in Cognitive Neuroscience Dietmar Heinke, Glyn W. Humphreys, Andrew Olson, 2012-12-06 1 Introduction This volume collects together the refereed versions of 25 papers presented at the 5th Neural Computation and Psychology Workshop NCPW5 held at the University of Birmingham from the 8th until the 10th of September 1998 The NCPW is a well established lively forum which brings together researchers from a range of disciplines artificial intelligence mathematics cognitive science computer science neurobiology philosophy and psychology all of whom are interested in the

application of neurally inspired connectionist models to topics in psychology The theme of the 5th workshop in the series was Connectionist models in cognitive neuroscience and the workshop aimed to bring together papers focused on the inter relations between functional psychological accounts of cognition and neural accounts of underlying brain processes linked by connectionist models From the very beginnings of modern psychology with the work of William James and his contemporaries researchers have believed it important to relate behavioural analyses to neurological underpinnings However with the advent of connectionist modelling where models are at least inspired by neuronal processes this enterprise has received a new boost With this volume we hope that this volume adds one further mosaic stone to this ambitious objective of unifying functional and neuronal accounts of performance

Brain Networks for Studying Healthy and Pathological Aging Mechanisms and Intervention Efficacy Christos Frantzidis, Ana B. Vivas, Panagiotis D. Bamidis, 2020-11-18 Previous studies showed that both healthy and pathological aging are associated with changes in brain structure and function of the mature human brain The most prominent anatomical alteration are changes in prefrontal cortex morphology volume loss and reduced white matter integrity and hippocampal atrophy Cognitive decline affects mainly the performance of episodic memory speed of sensory information processing working memory inhibitory function and long term memory It has been also proposed that due to the aforementioned changes the aging brain engages in compensatory brain mechanism such as a broader activation of cortical regions mainly frontal rather than specialized activation Evidence suggests that similar changes occur with pathological aging but to a greater extent In this case information flow is disrupted due to neurodegeneration functional activation of posterior occipito temporal regions is decreased and as a consequence the brain fails to process sensorial input in the ventral pathway and cognitive deficits appear In the last years functional alterations associated with aging have been studied using the mathematical notion of graph theory that offers an integrative approach since it examines different properties of the brain network 1 Organization level 2 amount of local information processing 3 information flow 4 cortical community structure and 5 identification of functional anatomical hubs So graph theory offers an attractive way to model brain networks organization and to quantify their pathological deviations Previous studies have already employed this mathematical notion and demonstrated that age related neurodegeneration is often accompanied by loss of optimal network organization either due to diminished local information processing or due to progressive isolation of distant brain regions They have also found that changes in network properties may be present even in the preclinical phase which could be taken as a biological marker of disease
