Plant nutrition and photosynthesis

1 Photosynthesis and respiration

1.1 Photosynthesis

- Converts light energy into the chemical energy of sugars and other organic compounds, i.e.
 - $\text{CO}_2 + \text{H}_2\text{O} + \text{energy sun} \rightarrow \text{carbohydrates} + \text{O}_2$
 - chemical energy is stored in the form of glucose (a carbohydrate)
 - secondary products: other carbohydrates, lipids, proteins.
- Photosynthesis process occurs mainly within the leaves:
 - CO_2 is obtained through stomata
 - H_2O is obtained through the roots
 - sunlight is absorbed by chlorophyll located in chloroplasts – site of photosynthesis
 - O_2 is released through stomata.
- Importance of photosynthesis:
 - production and renewal of almost all the atmospheric oxygen
 - provision of food for all plants and animals
 - production of fossil fuels (coal, natural gas and oil) from plant and animal remains
 - reduction of CO_2 in the atmosphere.
- Energy produced is used in respiration.

1.2 Respiration

- Plants and animals break down energy-rich organic compounds into simple inorganic compounds
 - – release large amounts of energy for cellular work necessary for growth and reproduction, i.e.
 - $\text{carbohydrates} + \text{O}_2 \rightarrow \text{CO}_2 + \text{H}_2\text{O} + \text{chemical energy}$.

Table 1 The differences between photosynthesis and respiration

Photosynthesis	Respiration
• produces food • stores energy • consumes H_2O • consumes CO_2 • releases O_2 • light-dependent	• consumes food • releases energy • produces H_2O • produces CO_2 • consumes O_2 • light-independent

[Recipe for a Livable Planet](#) William Sutton, Alexander Lotsch, Ashesh Prasann, 2024-10-16 The global agrifood system has been largely overlooked in the fight against climate change Yet greenhouse gas emissions from the agrifood system are so big that they alone could cause the world to miss the goal of keeping global average temperatures from rising above 1.5 centigrade compared to preindustrial levels Greenhouse gas emissions from agrifood must be cut to net zero by 2050 to achieve this goal *Recipe for a Livable Planet Achieving Net Zero Emissions in the Agrifood System* offers the first comprehensive global strategic framework to mitigate the agrifood system's contributions to climate change detailing affordable and readily available measures that can cut nearly a third of the world's planet heating emissions while ensuring global food security These actions which are urgently needed offer three additional benefits improving food supply reliability strengthening the global food system's resilience to climate change and safeguarding vulnerable populations This practical guide outlines global actions and specific steps that countries at all income levels can take starting now focusing on six key areas investments incentives information innovation institutions and inclusion Calling for collaboration among governments businesses citizens and international organizations it maps a pathway to making agrifood a significant contributor to

Food Security, Nutrition and Sustainability Through Aquaculture Technologies

Jitendra Kumar Sundaray, Mohd Ashraf Rather, Ishtiyag Ahmad, Adnan Amin, 2024-12-31 Aquaculture is the farming of aquatic organisms such as fish crustaceans mollusks and aquatic plants It is a rapidly growing industry that plays a significant role in providing food security improving nutrition and promoting sustainability Food security is a major global concern with millions of people around the world suffering from malnutrition and hunger Food security nutrition and sustainability are global challenges that need urgent attention to achieve a better and more sustainable future Aquaculture technologies can help to address this problem by increasing the availability and accessibility of fish and other aquatic foods providing a source of protein rich food improving nutrition enhancing sustainability generating income and improving food safety In addition aquaculture technologies play an important role in promoting nutrition Fish and other aquatic foods are a good source of essential nutrients that are important for human health including omega 3 fatty acids vitamin D and minerals like iron and zinc By increasing access to these foods aquaculture can help to improve nutrition and reduce the incidence of diet related diseases Fish and shellfish are rich in omega 3 fatty acids which have been linked to improved heart health brain function and other health benefits By incorporating fish and shellfish into their diets people can improve their overall nutritional intake and reduce the risk of chronic diseases Food Security Nutrition and Sustainability Through Aquaculture Technologies shines a light on how aquaculture technologies contribute to sustainability by providing a more efficient and environmentally friendly way of producing food Compared to traditional fishing practices aquaculture can reduce pressure on wild fish populations and minimize the negative impact of fishing on marine ecosystems Additionally advances in aquaculture technology have led to the development of more sustainable and efficient production systems including recirculating aquaculture systems and integrated multi trophic aquaculture As the global population continues to grow demand for protein rich foods like fish is increasing Aquaculture provides a sustainable way to meet this demand as it can produce more protein per unit of feed than traditional livestock farming This book discusses aquaculture practiced in areas where traditional agriculture is not feasible such as regions that are unsuitable for crop production In addition to providing a source of protein aquaculture can also improve nutrition Aquaculture can be practiced in a sustainable manner with minimal impact on the environment Unlike traditional fishing which can deplete wild fish populations and damage marine ecosystems aquaculture allows for the controlled cultivation of fish and other aquatic organisms Properly managed aquaculture operations can also minimize waste and pollution and can even contribute to ecosystem restoration by providing habitat for marine species This book includes chapters on various aspects of aquaculture technologies that address a range of important global challenges including food security nutrition and sustainability and are likely to play an increasingly important role in meeting the world's growing demand for food

Climate Science, Solutions and Services for Net Zero, Climate-Resilient Food Systems Pete Falloon, Aled Jones, Siemen Van Berkum, Stefan Kepinski, Mike Rivington, 2024-05-06 Food systems are both a major contributor to global greenhouse gas emissions and are strongly impacted by climate change and weather extremes Solutions to deliver net zero food systems therefore need to take climate impacts adaptation and resilience into account in order to ensure they are appropriate in a changing climate and do not conflict with adaptation goals In a similar way adaptation options for the food system must consider potential trade offs consequences and synergies with net zero and other objectives such as the Sustainable Development Goals Solutions for net zero climate resilient food systems will therefore require systematic interdisciplinary approaches across academia governments business NGOs and the public

The Impact of Climate Change and Bioenergy on Nutrition Brian Thompson, Marc J Cohen, 2012-04-23 Climate changes will affect food production in a number of ways Crop yields aquatic populations and forest productivity will decline invasive insect and plant species will proliferate and desertification soil salinization and water stress will increase Each of these impacts will decrease food and nutrition security primarily by reducing access to and availability of food and also by increasing the risk of infectious disease Although increased biofuel demand has the potential to increase incomes among producers it can also negatively affect food and nutrition security Land used for cultivating food crops may be diverted to biofuel production creating food shortages and raising prices Accelerations in unregulated or poorly regulated foreign direct investment deforestation and unsustainable use of chemical fertilizers may also result Biofuel production may reduce women s control of

resources which may in turn reduce the quality of household diets Each of these effects increases risk of poor food and nutrition security either through decreased physical availability of food decreased purchasing power or increased risk of disease The Impact of Climate Change and Bioenergy on Nutrition articulates the links between current environmental issues and food and nutrition security It provides a unique collection of nutrition statistics climate change projections biofuel scenarios and food security information under one cover which will be of interest to policymakers academia agronomists food and nutrition security planners programme implementers health workers and all those concerned about the current challenges of climate change energy production hunger and malnutrition
