way travel times and departure dates are presented for round trips requiring the minimum total velocity increment For both single pass and orbiting Venusian probes the time span available for launch becomes appreciable with only a small increase in velocity increment capability above the minimum requirement Velocity increment increases are much more effective in reducing travel time for single pass probes than they are for orbiting probes Round trips composed of a direct route along an ellipse tangent to Earth's orbit and an aphelion route result in the minimum total velocity increment for wait times less than 100 days and mission times ranging from 145 to 612 days Minimum total velocity increment trips may be taken along perihelion-perihelion routes for wait times ranging from 300 to 467 days These wait times occur during missions lasting from 640 to 759 days
