determination of non nutrient biologically active natural substances in foods The analysis and metabolic studies of amino acids peptides proteins lipids sugars carbohydrates and vitamins is also discussed with separate chapters on mineral and micronutrient metabolism and techniques of pyrolysis mass spectrometry Mass Spectrometry of Natural Substances in Food will be a valuable resource for food scientists food analysts and others working in food research nutrition and safety

Rapid Methods for Analysis of Biological Materials in the Environment Peter J. Stopa, Michael A.

Bartoszcze, 2013-04-17 Contrary to common belief infectious diseases are not as well under control as we would like We are now at a crossroads regarding the impact of the environment on infectious diseases Renewed interest in biological weapons and the emergence of new pathogens coupled with a better understanding of the impact of infectious agents on other conventional diseases has led us to realise that we can no longer remain complacent about the impact of infectious agents on human animal and crop health The present book first discusses current and emerging military and civilian policies on the environment In addition the impact of environmental biology on the future of space exploration is discussed especially in reference to the Mars mission There follows a discussion of the state of bacteria in the environment with a presentation of current and emerging techniques of microbial investigation Finally two case studies are presented on the impact of these techniques on both political and environmental problems

Nano-Biomaterials in Tissue Repair and Regeneration Necdet Sağlam, Feza Korkusuz, Mesut Şam, 2024-11-22 This book covers the characterization of nano biomaterials in tissue repair and regeneration which are materials designed to interact with biological systems to restore and regenerate damaged tissues These materials serve as scaffolds that mimic the natural extracellular matrix ECM providing structural support and biochemical cues necessary for cellular activities The physical and chemical properties of biomaterials are tailored to specific applications such as bone regeneration cartilage repair wound healing and organ transplantation Biomaterials influence cell behavior and tissue formation by controlling factors like mechanical strength porosity and surface topography This book provides an overview of the topic from the biomaterials characterization point of view and is suitable for students academics and clinical practitioners who are interested in the advancements of regenerative medicine

Modification, Characterization and Process Monitoring Analytics to Support Biofuel and Biomaterial Production

Robert Henry,Blake Simmons,Jason Lupoi,2016-06-09 The conversion of lignocellulosic biomass into renewable fuels and other commodities has provided an appealing alternative towards supplanting global dependence on fossil fuels The suitability of multitudes of plants for deconstruction to useful precursor molecules and products is currently being evaluated These studies have probed a variety of phenotypic traits including cellulose non cellulosic polysaccharide lignin and lignin monomer composition glucose and xylose production following enzymatic hydrolysis and an assessment of lignin carbohydrate and lignin lignin linkages to name a few These quintessential traits can provide an assessment of biomass recalcitrance enabling researchers to devise appropriate deconstruction strategies Plants with high polysaccharide and lower lignin contents have been shown to breakdown to monomeric sugars more readily Not all plants contain ideal proportions of the various cell wall constituents however The capabilities of biotechnology can alleviate this conundrum by tailoring the chemical composition of plants to be more favorable for conversion to sugars fuels etc Increases in the total biomass yield cellulose content or conversion efficiency through for example a reduction in lignin content are pathways being evaluated to genetically improve plants for use in manufacturing biofuels and bio based chemicals Although plants have been previously domesticated for food and fiber production the collection of phenotypic traits prerequisite for biofuel production may necessitate new genetic breeding schemes Given the plethora of potential plants available for exploration rapid analytical methods are needed to more efficiently screen through the bulk of samples to hone in on which feedstocks contain the desired chemistry for subsequent conversion to valuable renewable commodities The standard methods for analyzing biomass and related intermediates and finished products are laborious potentially toxic and or destructive They may also necessitate a complex data analysis significantly increasing the experimental time and add unwanted delays in process

monitoring where delays can incur in significant costs Advances in thermochemical and spectroscopic techniques have enabled the screening of thousands of plants for different phenotypes such as cell wall cellulose non cellulosic polysaccharide and lignin composition lignin monomer composition or monomeric sugar release Some instrumental methods have been coupled with multivariate analysis providing elegant chemometric predictive models enabling the accelerated identification of potential feedstocks In addition to the use of high throughput analytical methods for the characterization of feedstocks based on phenotypic metrics rapid instrumental techniques have been developed for the real time monitoring of diverse processes such as the efficacy of a specific pretreatment strategy or the formation of end products such as biofuels and biomaterials Real time process monitoring techniques are needed for all stages of the feedstocks to biofuels conversion process in order to maximize efficiency and lower costs by monitoring and optimizing performance These approaches allow researchers to adjust experimental conditions during rather than at the conclusion of a process thereby decreasing overhead expenses This Frontiers Research Topic explores options for the modification of biomass composition and the conversion of these feedstocks into to biofuels or biomaterials and the related innovations in methods for the analysis of the composition of plant biomass and advances in assessing up and downstream processes in real time Finally a review of the computational models available for techno economic modeling and lifecycle analysis will be presented
